June 1983. Price 50p

THE 4TH INTERNATIONAL
COMMODORE COMPUTER SHOW
THURSDAY 9th - SATURDAY 11th June 1983
COURT INTERNATIONAL HOTEL
HAMMERSMITH LONDON

Ireland of the welcomes

Here in Ireland we have
an expression in Gaelic
"Cead Míle Fáilte"
It means one hundred
thousand welcomes.

But we are more than just
a country of natural beauty and beautiful scenery.
The Irish economy is undergoing
a technological revolution
essential to the future of our country.

Let Commodore Concessionaires Ireland Ltd
tell you about it at stand 35.

Contents

An Editorial	3	The Fourth International Commodore Computer Show	33
Our first and only Editorial in <i>Commodore User</i> — it's not something we want to make a habit of, but it makes sense to take a few words to introduce this inaugural issue of a brand new magazine.		Bigger, better and bolder than ever before, the 1983 Commodore Show takes over Hammersmith on 9-11 June. Read how to get there and what you'll find on the stands — a comprehensive 32-page guide with helpful instant summaries, the complete stand plan, and a full run-down on the exhibitors (not to mention our favourite local eateries and pubs).	
New to us	7	Holiday with a computer?	65
A page of news, backchat and rumour — mostly about companies and products you'll see at the Commodore Show.		Computer-based 'activity' holidays are sprouting like freckles on a redhead in the Summer. We located a dozen of them and asked the pertinent questions — what they provide, when, how much.	
Making money from your hobby	11	Radio Ham with a Vic	68
The truth about part-time software millionaires. Adrian Jones spoke to some of the prospective purchasers and publishers for your brilliant programming: what do they want? And what do you get in return? But then Chris Preston draws on some hard-earned experience for the other side of the coin...		RTTY on the Vic? Amateur radio enthusiast and Vic expert Mike Todd offers a tour of the possibilities, with reviews of the RTTY packages we could find on sale.	
Your records on a microcomputer?	17	Aids for programmers	77
As it happens, keeping records is a natural for the computer — and now there are many low-cost computers with relatively inexpensive software packages that will provide you with rather more than an automated filing cabinet. We present a beginner's introduction to the subject.		People who write Basic programs on Commodore computers will know the virtues of instant assistance — automatic line renumbering, changes, deletions and the like. Mike Todd looked at four for the Vic, gives a full review on each, and rates them on value for money.	
All about assembly language programming	23	Super SID!	83
Writing in assembler language is supposed to produce programs that run faster than those in Basic. But it's also supposed to be considerably more difficult. David Pinless starts a six-part novice's guide to assembler programming; and to set alongside it we have an impressive demonstration of the speed difference.		Colour on the Commodore 64 is pretty good, too — but even more impressive is the 64's built-in SID sound synthesiser chip. Kent Muir gives a guided tour of SID, shows you to how to get the most from the 64's sound, and suggests some clever uses for it.	
Build yourself a better Basic	29		
But if you stick with good old Basic, the language that is built into all Commodore machines, you can still do it better. Chris Preston unfolds the not-so-arane mystenes of 'structured' programming.

TECPACS

Add high-quality software to your Commodore

Tecpacs are written and tested by professionals and produced by the Technical Software Centre, to provide reliable software for industry.

Tecpacs are available on gear and beam design; pressure drop calculations; statistical analysis, and we are adding new titles all the time. Take two of our best sellers: PLAN-KIT and the Building Services Suite of Programs

Plan-Kit

The project control and forward planning micro program for managers and supervisors

With PLAN-KIT, from organisation conference to commissioning a factory or building, PLAN-KIT helps you to control and coordinate every activity and its timing.

PLAN-KIT is easy to use: you don't have to be a computer expert, and you can key in up-to-date information at any stage to obtain a new analysis of your project's progress.

PLAN-KIT

Costs just £250 plus VAT, includes a manual, a user's guide, and is available on computer.

Uses the precedence technique to determine the order.

Offers the choice of running with a calendar or continuous time base. Plus many more features offered by this comprehensive planning package.

PLAN-KIT costs just £250 plus VAT... so that it will pay for itself the first time you use it, just because PLAN-KIT keeps you up to date and helps you to do your job more effectively.

Building Services Programs

A comprehensive series of micro programs for engineers and designers working on Building Services

Save time and money with this practical suite of programs which cope with the calculations while you concentrate on the design and choice of parameters.

Originally written by a leading mechanical/electrical contractor following CIBS standard procedures, these micro programs have now been developed in the Tecpac format to provide a cost-effective suite of 4 related packages covering:

Heat Gains Calculations

Pack 1: £900 for a suite of 4 programs

Heat Loss Calculations

Pack 2: £900 for a suite of 4 programs

Pipe and Duct Networks

Pack 3: £600 for a suite of 4 programs

Electrical Lighting

Pack 4: £450 for a suite of 3 programs. Buy the complete 4 packs for £1800 and save £450.

Individual programs can also be obtained from Tecpac: prices available on request.

Also available to special order programs on: Daylighting, Floodlighting, Heating Pipe Sizing, CWS/HWS, Noise calculations.

Welcome to the first issue of *Commodore User*, the new magazine for everyone who has an interest in getting the most from Commodore computers.

Commodore User comes from the Paradox Group — small, independent, but above all specialised. You may know of us from *Vic Computing*, the magazine dedicated to the Vic-20; but that is only one of our titles devoted to specific microcomputers and specific uses of computers. To put it simply, we specialise in writing about small computers; and we specialise in writing about the practical uses of those computers.

We run such computers ourselves both for business and for pleasure — so we know what we're talking about.

And we know what you want to read about. We buy additional hardware, software, and services; we write and use programs; we have to struggle with the same user manuals that you do; we have all the pleasures and problems of the real-world microcomputer user... so we know what the user wants to hear.

Commodore User will reflect all of that. We will be covering the full range of Commodore products — though our bias will naturally be to the mass-market sellers like the Vic and the Commodore 64, where the sheer range of options for the user and the variety of possible uses justify the presence of an authoritative commentator and educator like the new magazine. We will not be neglecting the 700s and 8000s, however.

So what sort of magazine will you be buying?

We start from three premises. First, *Commodore User* will be useful. That means *Commodore User* will not be abstruse and technical: our articles will cover a good range, but the stress will be on practicality and general relevance to the bulk of our readers.

Second, *Commodore User* will be authoritative. We have already signed up some of the best technical columnists to explain the idiosyncracies of the Commodore computers, to answer your queries, to review the kind of add-on products you should or should not be considering. To help you get more out of your acquisition, in fact.

And we don't regard the 'best' commentators simply as those that know what they're talking about. We also demand that they can express themselves articulately; their contributions are readable as well as knowledgeable.

That's the third point — *Commodore User* will be a good read. We're not trying to produce a reference book or a technical manual. So we spend money on the design of the magazine, trying to make it look good and trying to make the format suit the information. We spend time revising and editing the articles, ensuring that the writing style makes the subject comprehensible (and maybe entertaining too). We plan our issues for balance, covering a variety of topics and a range of different levels of knowledge so that there's something for everyone in each issue.

We care about what we do. And, unlike some micro magazines, we care about what you the readers want.

How and when?

This is the pilot issue of *Commodore User*. We have taken the opportunity of the Commodore Show to incorporate the Official Show Catalogue in the new magazine before our official launch on the newsstands: that gives you the chance to see what we'll be doing, and it gives us the chance to sort out the look and content of *Commodore User* for the future.

From the Autumn you'll be able to buy *Commodore User* every month at bookstands and newsagents as well as on subscription. The cover price will be 85p. We are printing around 70,000 copies of each issue and we're aiming for an average of between 60 and 120 pages.

Commodore User will incorporate *Vic Computing*, of course, and existing subscribers will find their subs honoured with the new mag; and we'll be extending the coverage to include the other current and future Commodore machines — like the hand-held computer, the portable 64, whatever replaces the Max, and so on.

Launching a new magazine is always a gamble. But we know *Commodore user* will be filling a need: and we're sure that we will produce the kind of magazine you will want to read. With your support and our confidence *Commodore User* will be not only one of the most useful publications on the newsstands but also one of the most successful.

Integrated Accounting System

One of the premier accounting packages available for Commodore business systems.

- **Modular** – You choose which combination you need
- **Fully integrated** – All postings made from a single entry
- **Requires only two disks** – No complicated disk changing
- **Large volumes** – Several thousand accounts/stock items/transactions
- **Multi-company** – Up to 5 companies accounts on 2 disks
- **Multi-ledger** – Up to 5 sales/purchase ledgers per company

Simple to learn and operate robust and safe to use, well proven – 700 + live installations – 3 years development and sale worldwide – commodore approved product for 2 years, approved and used by professional accountants Fully approved by H M C & E for VAT

Available on 8032/8096 computers
8050/8250 disk drives
Any printer

Price £300.00 per module

Also available on the new CBM 700 Series

DIGITMASTER

SEE US
ON
STAND B76

Now Jentech Services bring you the Digitmaster. A highly advanced Micro computer aided draughting system. Versatile, flexible and developed to handle a large range of design functions.

Easy data entry

The Digitmaster could not be simpler to operate. The designer enters a drawing directly from the keyboard or via the plotter as a series of points or lines. The lines can be defined from datums, and drawings are built up by straight and curved lines, circles and arcs of circles. Menu and keyboard codes are shown clearly on the screen throughout the operating process.

Fast drawing production

Drawings can be rapidly built up from sub drawings already stored on disk using the Digitmaster's powerful merge routines. This allows for the use of previous work, easy call up of standard details, and savings of designer's time by a lower level of checking being required.

New Twin screens

The Digitmaster now has a screen graphics option in addition to the prompt screen essential for easy operation. This gives immediate feedback to the operator and allows easy alteration of drawings on the screen. With the system being compact the Digitmaster will put any design office at the forefront of the ever developing information age – and keep it there for many years to come.

- ☆ Rapid storage and recall of drawings
- ☆ Automatic dimensioning and lettering
- ☆ Easy modification of drawings
- ☆ Menu driven throughout
- ☆ Full editing and merge facilities
- ☆ Digitizing function allows tracing of complete curves etc
- ☆ Automatic scaling
- ☆ High quality output
- ☆ Store and reproduce in full colour
- ☆ Reduce time and cost
- ☆ Plotting speed under software control up to 400mm/sec
- ☆ 10 pen types available

See us on stand B76

New to Commodore users

Beating Lisa

The computer press and the nationals too have gone into orgasmic overdrive on the Apple Lisa, an \$8,000+ 'personal computer' for big-company executives that features a built-in liling system, lots of on-screen symbols that you 'point' to with the cursor instead of typing commands, and a cable-attached 'mouse' that actually moves the cursor.

Well, it looks as though Commodore has an equivalent system up its sleeve, and looking at the way the 64 is being sold so heavily as a low-price competitor for the geriatric Apple II, the Lisa equivalent could well be a most cost-effective alternative.

Few official details are available. But a price of \$4,000 is being bandied about; and from what we can gather, the specification will almost certainly feature a housing similar to that being supplied on new 8000-series Pets and the 700, with the built-in floppy disk drives — but one of them will probably be a Winchester, one of the new generation of 'low-profile' (which means 'flatish') hard-disk units.

Inside the thing there will be one processor running the CP/M operating system and a second one providing a degree of compatibility with existing Commodore programs. That latter will probably be the 6509 chip as used in the 700 (it should be able to run programs from the 64 and 8000 as well).

The CP/M-oriented processor could be a Zilog Z80A, which means you'll get the eight-bit version of CP/M — and there are literally hundreds of CP/M-80 programs around. But in view of Commodore's link-up with Zilog, it's more likely to be the 16-bit Z8000 — in which case we'll see CP/M-86 (or a version of it) with the much more powerful programs that are available for it.

Portable 64

Coming soon — the Osborne alternative! Commodore's first portable computer is a 64 in a carrying case. It is currently named the SX-100, though that might be changed; and production is apparently under way already, though not more than a few thousand of them will be built this year.

The internals are the standard Commodore 64 (including the SID chip) — but of course it's the external packaging that is of more interest. The SX-100 comes as a box 125mm high, 370mm wide and 370mm deep; the keyboard, which is a full-size unit with 'real' keys and the four function keys too, clips on to the front. Unclipping it for use, you'll find a two-foot cable so you wouldn't have to perch in front of the thing all the time.

The carry handle doubles as a stand for the front of the box, and the upwards tilt makes the screen quite readable. When clipped together the keyboard hides the floppy disks (one or two of them — both are the 1841 drives that are now standard for the Vic and the 64) and a five-inch monitor.

That little screen isn't too bad, but no-one would want to look at it all the time. Fortunately there's a socket for a decent-sized display in the form of an external monitor. This is in the top of the box, where you also get the 64's cartridge slot (for more memory and/or an RS232 printer or modem converter) and an IEEE serial port (for a Commodore printer).

There will probably be three variants — monochrome screen with one disk (US price around \$995), a twin-disk version, and one with two disks and a colour display (about \$1,600). First shipments are promised for early this Summer, but then we should all be used to Commodore's delusive promises by now.

The mountain comes...

Coming to Mahomed: "Supplying computers at a price which people can afford is a religion at Commodore" — another pearl of wisdom from the lips of general Jack Trammel, boss of Commodore Intergalactic talking to a Hanover press gathering.

...Now read on: "We produce for the masses, not the classes" A snippet from *The Commodore Philosophy*, a cheery little work for Commodore employees. Author Jack Trammel. Sounds like God and Marxism can mix.

...And again: Oh no, not more of it! "Business to us is not a sport. It's war!" Also from the *Philosophy* and it goes on: "Treat every penny as your own." Hmm. Interesting philosophy, thus, that manages to combine religion, socialism and Mammon so effectively with Samuel Smiles (Vicarious thanks to Guy Kewney, who reported this lot in the ace trade paper *Micro Scope*.)

Anti-hire

The new Computer Trade Association says it will "represent the interests of all sections of the industry: retailers, distributors, software houses, manufacturers and consultants".

And what's it for? "The Computer Trade Association is pledged to achieve a professional code of conduct to govern dealings both within the Trade and between the Trade and the Public; legal clarification of the current uncertainty of computer software copyright; to fight software piracy; and to help coordinate member interests at major exhibitions. But the most important campaign that the Association has so far initiated is the control of the rapid growth of unauthorised software libraries..." Or to put it another way, "The Association is opposed to any form of hiring or lending of tapes, disks, cartridges etc by direct or indirect means, without authorisation from the author, his or her agent and publishers".

Existing members of the Association are Atan, Buffer Micro Shop, Bug-Byte, Computers, Grundy, Silversoft, Tandy and Virgin Games.

Easy price

A company called Viza Software has two brand new products for the Commodore 64. VIZAWRITE claims to be "not just another microcomputer word processor, it's the real thing, just like the ones with the \$5,000 price tag... You've heard this before but this time it's true..." VIZAWRITE is \$59 plus VAT. VIZAWRITE claims to offer "all the usual word processing facilities — nothing really out of the ordinary, it's not supposed to be — but what we can't show you on paper is how easy to use it is, and how sensible and powerful the commands are". Sounds ok to us.

The new Commodore 64 is the most powerful personal computer available to the businessman.

And amazingly, it's one of the least expensive

A brilliant example of micro-computer technology, it will do a lot to make your business more efficient and more profitable.

The range of software—general and specific—is very extensive, and covers financial planning, word processing, information handling and countless other business and personal tasks.

The Commodore 64 is the ideal personal computer for the office. It is also ideal for the home, whether this is your 'second office' or main place of business.

It means that the scope of take-home work is no longer limited to what papers can be carried in a bulging briefcase.

A Commodore 64 at home could allow you access to all the information stored at your company office immediately, easily and with complete security, simply by linking up to any TV set or monitor.

For the office. Or the

SUPERIOR WORD PROCESSING

WORDFORM

WORDFORM 2.2 with SPELLCHECK

£350 plus VAT

*

This is what COMMODORE
COMPUTING INTERNATIONAL
had to say about WORDFORM 2:
"Despite the low price, it will
perform all the functions that one
has now come to expect from a
word processing program on a
Commodore machine. Extra text
areas, background printing
numerical functions within the
main program, right justification
and so on.
To sum up, it does just about
everything that all the others do, it
is definitely the cheapest, and it is
one that a secretary will feel more
at ease with on a first encounter."

SUPERIOR PROGRAMS FOR THE CBM PET

PAYROLL and SSP

If you are responsible for payroll
we will make 'payroll day' the day
you look forward to, rather than the
day you dread!

More and more companies,
accountants and even bureaux, are
finding that running their payroll is a
pleasure with the payroll program
that gives new meaning to the
overworked phrase 'user friendly'.

The name of this program is
PAYROLL 2 and it runs on the
Commodore CBM 8000 and 700
microcomputers.

It would make very great sense to
ensure you see a demonstration of
this remarkable program before
purchasing a payroll package. It
would be highly frustrating to
purchase another and then become
aware of the PAYROLL 2 excellence
afterwards.

The price for transforming your
payroll days is £375. The hardware,
if you don't possess it will cost
round £2300 (prices subject to VAT).

From your Commodore Dealer or
send for a leaflet to:

LandSoft 

28 Sheen Lane London SW14 8LW
Telephone: 01- 878 7044/7

SUPERIOR PROGRAMS FOR THE CBM PET

The Tale of Teenage Software Millionaires

the truth behind the hype

by Adrian Jones

Would you care to make some money from your computer? There's an awful lot of software out there for 'home' computers. We asked Adrian Jones to find out where it's all coming from — and how you too can start raking in some of the rewards of being a freelance program author.

A special mission awaits me. I'm the commander of a starfleet roaming the universe searching the planets for aliens to zap. But first, I've got to go to Laskey's to get this cassette. You see, I received this Vic for Christmas and all my aggression can now be channelled into attacks on preventing or initiating seaborne invasions and zapping the nasties.

But being a clever sod, I feel I can do better than a lot of these efforts. I mean, how many Darth Vader clones can a man take? So I've sat at my Vic for ages, and my eyes are red and my typing finger has callouses; but I've got the game written. And I'm sure there is oodles of cash waiting for me — but hold on, how exactly do I go about calling my software? What does the market want? Is there a market? Self-doubt taunts me. I'd like money, not an eight-inch stack of rejection letters.

I spoke to six companies who market software programs and games. All were unanimous in the view that there is money in writing programs, but they all said too that teenage software millionaires are few and far between — discount all the TV programmes and Daily Mail stories about thousands of 16-year-olds earning a bomb. Most of the software publishers are searching for new products, but you'll have to be an Albert Schweitzer of software to carry off the Holy Grail — just be content with a place at Camelot.

But you can make a tidy sum; and if it's something you enjoy doing, then the more the better.

The big day arrives. You receive a letter from the firm you sent your idea to. Feverishly opening the buff-coloured envelope you give them a clear impression

of what he was offering. No chance. Most firms require a completed game before they can act.

All the firms I spoke to (and I presume most other software firms) get their games and programs from a mixture of in-house workers beavering away and unknown authors sending in unknown and untried games; **AudioGenic** also get a lot of its catalogue products under licence from firms in the USA.

But it looks as though more than half of the software published these days comes from you — the people with your Vics and Commodores sitting at home struggling with a game to make your name.

For instance, **Rabbit Software** receives 10 to 12 tapes a month, **Bug Byte** of Liverpool gets at least two a day. **Virgin Games**, since it started up three months ago with a lot of press comment and the subsequent advertising, says its mailbags have been overflowing with contributions. "We've received a helluva lot. 50 per cent of the tapes received are rubbish, but there is a lot of talent around", says Nick Alexander at Virgin.

That's a lot of work and a lot of time to be told what you've

either read: "Thanks, but no thanks," "great, but we'll need a few adjustments — like a joystick option" (in which case they'll let you, the programmer, do it), or sent in is useless. On the other hand — and here comes the cheery bit — games that are good seem to be of a very high standard. Alan Maton of Bug Byte, for instance, told me that there was lots of software talent in the North — and especially Liverpool, for some reason. And Gail Wellington at **Commodore** says that the UK in general is a good source for software programs. So, you good programmers, go for it!

Start thinking

Now assuming that you've got your game finished, you are going to send it to a software firm. How do you do it?

Well, for a start none of the firms I contacted will even look at an unsolicited piece of software unless it come through the letterbox as a cassette. The majority of hopefuls follow this golden rule, but a few send in scenarios or listings (which are especially laborious).

The day I spoke to Bug Byte they'd just received a series of photographs which the sender had hoped would "brill, come in and ink the

dotted line."

It's only Commodore which seems to provide any kind of any evaluation and grading system for those rejected. This seems like a good idea; you'll know where you went wrong.

Ok, there's a great grin on your face, you've been accepted. Daydreams of fame and cash swirl in front of your eyes. How are you paid?

Royalties are the most common way, but the money varies with the quality of the game. Bug Byte used to do it on a straight sales basis, but that was too time-consuming and now they pay a premium on each cassette. Say they sell 5,000 cassettes of a game; the author will receive 5,000 times whatever premium has been agreed.

Virgin Games aims to give a royalty of five to ten per cent — a little lower than most firms, who typically offer 15-20 per cent, but then Virgin calculates its 100 per cent take from the gross income of the product (which might mean T-shirts, offshoots etc) rather than from sales of the cassette alone.

The other way in which you can gather in the copeciks is by an outright sale of your game. This is usually done if you are in

WORD PROCESSOR?

Yes! One of the best!

Quick Brown Fox word processing has more features than most other software and runs on your VIC-20 or Commodore 64 computer. Put yourself in league with industry standards like WORDSTAR, SCRIPSIT, WORDCRAFT and WORDPRO. We can supply you with a complete first-class word processor for less than £1,000 – this includes computer, additional memory, 80 column display monitor and a daisy-wheel typewriter which doubles as a computer printer.

It all starts with the Quick Brown Fox software at £60

(all prices excluding VAT)

**SEE US ON STAND 30
AT THE INTERNATIONAL WP
EXHIBITION, WEMBLEY
24th–29th MAY**

seller at the moment, *Blitz*, "it's easy to operate, nice and clean... and it was sent in," says Gale Wellington. It's also original and clever.

Forget about copies of already-existing arcade games: concentrate on originality combined with a high degree of interest for the user, variation and good colour. Virgin asks that adventure games be fast-moving, though the people also begins with 5,000, but they say they aren't interested in anything which cannot ultimately sell 10,000 copies or more.

Lifespans vary: Mark Eyles at Quicksilver told me that since they entered the market about two years ago, all their programs are still selling. On the other hand, Gale Wellington at Commodore reckons the life of a Vic program averages about nine months — but "good quality can keep the game selling".

With the bestsellers it's hard to say. A good example of steady selling is *Amok*, brought out on Vic by Audiogenic in December 1981 and still shifting so well that Boots orders it 200 at a time.

Generally speaking you should expect about six months to a year of selling life; with the really exceptional ones demand may continue a time longer.

Now, what would you send to the firms. Another Pac-Man? Alan Maton of Bug Byte told me: "If I had a pound note for every time I got sent a *Snakes* I wouldn't be speaking to you now." There may be lots of prospective games authors out there, but it's the originality which counts Audiogenic asks that the games they receive shouldn't be just good, they should be "incredible." The punters have become more sophisticated: they expect realistic simulations and 3-D multi-colour graphics.

On the other hand that shouldn't be seen as a licence to produce games which are so complex that only the author can work them out — and then only after half a bottle of Jameson's.

there are trying to find new ideas away from the ubiquitous 'spaces' — we hear they have one due on the market soon called *Sheepdog Trials*.

Quicksilver has a bestseller called *Trader* — it's an intergalactic adventure (you know the sort, lots of moving around moons, dodging aliens etc) and also little bits of arcade influence; but most of all it's original (which is vital) and blessed with good graphics (which is important). It's also commendably witty.

Bug Byte again emphasises originality plus smoothness. People must be able to play it again and again. It must not halt on a high score, either, otherwise the punters will lose interest rapidly.

Artwork for the packaging (which the companies of course prepare) is generally seen as crucial, and the competition is "hot" (the words of Nick Alexander at Virgin). People will buy the game on the strength of what they can see on the shelves of WH Smiths.

If you want to be a bona fide star, we'd recommend you go to Virgin Games. They intend not only to feature the author's name on the back of the package but also to print your mugshot and a few words about you. Microcomputer software's first media stars! When you thought all games' authors were boffin-type wallies beavering away at their Vics, here comes the new breed.

Perhaps they'll also jazz up the instructions on the backs of packages. Too many of them veer towards an inexplicable campness. "Whatever happens, you will be remembered as a space hero of four times!" All that's needed is Kenneth Williams to complete it.

Games take up the largest part of the software market, but all the firms I spoke to dabble to some extent in other aspects of software. Rabbit Software is currently keen on a new business program called *Informant* — basically a programmable filing cabinet for records like names and addresses. Quicksilver has a program

called *Magic Window*, a clever character generator. Bug Byte is thinking of going into the educational market, but on the whole they want to leave it to the specialists.

Amongst those I spoke to, Audiogenic seems to have the strongest stake in all things software. It sells utilities, machine code monitors, chess games, educational games and arcade games.

Commodore also has a variety — including a series of educational games which have very good graphics, and a number of business-oriented packages. Education? It was pointed out to me by Gale Wellington that a child is more likely to learn multiplication if on getting the sums right he or she gets to sink a pirate ship.

Tips

Finally, I asked what rules should any aspiring author follow on the road to the top.

Everyone told me that originality was obviously of great importance; but so is the game idea — people must be able to play it and to enjoy doing so: at Rabbit I was told that the company received some brilliant games that don't appeal to the public and therefore won't sell.

Everyone told me they didn't need any more *PacMans* and *Froggers*. "City Bomber may be popular," said Nick Alexander at Virgin Games, "but there are already three versions on the market."

Quicksilver though said that if it received an excellent version of an existing arcade game, it probably would be bought. People want 'over the top' graphics ('they love it' — Mark Eyles of Quicksilver), they want sophistication, and most of all they want to know they're not wasting their money.

You should also call a few friends in before you submit anything they can have a go and hopefully tell you what familiarity has hidden from you.

As for programming the Basic language is OUT — except possibly madventure games. Machine code is now the norm.

▷ desperate need of the readers: remember, you will lose a lot if your game goes on to become a runaway success. You might receive money based on an average sale of 5,000 and the game will actually sell 15,000.

Commodore uses the outright purchase approach for not-so-outstanding software, which they'll utilise for freebies, Prestel etc.

Another way in which you may gain is by receiving new equipment in lieu of royalties; this also ensures a sense of loyalty to the firm from the author — this is usually for someone of proven ability. One of Audiogenic's authors had received about £1,500 in the last year, but in addition had been given new computers and a disk drive.

Mind you Audiogenic was much more cautious in its estimation of the amount of money about in the software market, saying that some firms exaggerated the figures to be earned.

On the other hand, Heather Lamont of Rabbit Software said that some of the successful games-people will earn £4,000 to £5,000 per game — and more successful authors have been known to go to £15,000. So the moral must be to go into this business with your money sense intact and your common-sense in tow.

How many? How long?

The first production run of a game will vary. Bug Byte launches a new program with a run of 3,000 copies, Rabbit produces 1,500-2,000, Commodore might have 3,000 to 5,000 for the UK (but then Commodore also looks for worldwide rights). Virgin

Take Commodore's best-

Make Money

▷ And chose your supplier with some care. Heather Lamont at Rabbit Software: "An awful lot of games aren't good. People usually do them as a sideline. People who write the programs can't sell them and that's where companies like us come in by marketing them." Audio-genic had this point to offer: "deal with reputable companies and don't be blinded by hype".

Step this way, Sir
So maybe you can turn your program into gold: soon you'll see whatever you've called it (not *Invaders*, please!) in Smiths, Lasky's, the pages of this magazine (being reviewed without mercy) or in a sweetshop surrounded by eager children.

Or maybe you'll get a letter telling you that what you've sent in is... well, not quite

what they wanted... sorry.

But if you get accepted, there will be something. Whether it's enough to buy a new Vic, a new disk drive or if it's just a bit of spare cash, it all depends on you and your ideas — and the marketing expertise of the company you're talking to.

Our advice, in brief: come up with an original scenario, put in some clever programming to make it fast

and colourful, and make sure that the punters will have enough information to play the game — and that there's enough in the game to maintain their interest.

Second, test it on some friends and/or strangers. Then look around for some prospective publishers — try the high street stores and the eds in magazines like this one to list a few you like the sound of. □

... And now the bad news

Devil's advocacy

by Chris Preston

So you think you've come up with a brilliant program. Everybody who has spent many nights working away at some beloved program hopes that there may be some reward other than just the satisfaction of a job well done or an admiring "Coo that's clever" from the nubile individual down the street.

Fame or (more likely) money seems to be a powerful spur, especially as there are several firms now marketing home-grown software. Chris Preston looked into the matter, and concludes that life is not as simple as we might wish.

The first problem is simply that there is a lot of money to be made from a really good program, which means that all over the country there are teams of expert program-

mers beavering away at all the most profitable areas. A self-taught programmer working in his or her spare time is unlikely to be able to turn out a product to match that produced by the professionals.

You are also unlikely to be able to sell your program yourself (it probably calculates some abstruse mathematical formula — bound to sell thousands of copies to Physics students), with all the costs in terms of time and money which are involved.

So you have to go to Floggit & Run International Ltd. to sell the software for you, in return for which favour they will pay you a royalty of five, 10 or 18 per cent. What they don't tell you is that the royalty is calculated on their selling price. So your program advertised at £23 a copy, earns only £2 once the VAT and retailer's mark-up have been allowed for.

The other problem is that nobody at Floggit & Run has the slightest clue how your program works. Nor have any of the dealers. So a prospective customer walking into High St Computer Mart is faced with a salesman who says "Bose-Einstein statistics? Search me guv. Try writing a program yourself".

Manual labour

A few people who do buy the program are completely baffled because the manual produced by Floggit & Run has a page missing, two others in the wrong order, and four with unreadable printing. They phone up their dealers, who pass the buck to Floggit & Run, who in turn pass it on to you. Poor programmer, your phone hardly stops ringing with customers annoyed after being stalled for so long (because nobody in the computer industry admits he doesn't know the answer to a customer's question without at least three weeks humming and hahing).

At the end of the first three months you have sold 35 copies a £70 cheque is enclosed from Floggit & Run. After the second quarter a cheque for £110 arrives.

"Great", you think. "Now it seems to be taking off! Next quarter I'll get a real big cheque!" The next quarter only 15 copies are sold, and Floggit & Run regret to inform you that they can no longer justify selling your program. The reason for the poor performance is not clear. A powerful new program from the States has made it outdated; rumour has it that the students of

East Grinstead University are running off pirate copies by the thousand; games programs often fail simply because the fickle public taste has changed.

Your wonderful program has earned you all of £210, of which you will pay £80 in Income Tax and Self-employed NI Contributions. Your accountant presents you with a bill for £70 to cover preparing your accounts for the year ending April 5, 1983. Net profit for the year? £50. Hardly the stuff of which fortunes are made, is it?

Writing books is even less lucrative. They sell for much less than programs, and the royalty rates are even less. I heard a story about a Professor of Medicine who spent several years with two colleagues writing a standard textbook for his students. When it was published all the libraries and Medical Schools in the country bought a copy each, and that was that. His sales amounted to about 500 copies. Total earnings for all his labours: a couple of hundred guid.

The pot of gold at the end of the rainbow is a long way away; and actually finding the start of the rainbow in the first place is a good way to go bald in frustration. □

THE SOLUTION

OUR SCIENTIFIC & INDUSTRIAL INTERFACE SYSTEMS

As the first interface specialists to provide IEEE-488, RS-232C, memory mapped and remote intelligent interfaces for the entire Commodore range in the industrial and scientific fields, we have an impressive number of satisfied customers to our credit.

They include British Steel, British Gas, ICI, Ford, Rolls Royce, a wide range of government departments and university and hospital laboratories.

Whatever your field - chemical, physical, biological or agricultural research, civil engineering, test and instrumentation, local/remote

industrial and environmental, process, monitoring and control - we are confident that our systems and service back up will fully meet your needs without overstretching your budget.

Choose from our range of IEEE-488, RS-232C compatible BASIC addressable units; opt for the multi channel, modular INLAB system; consider the advantages of our new multi channel simultaneous sampling data acquisition system, or make use of our custom design service.

All come with full warranty and client support to match your needs.

NOW, WHAT'S THE PROBLEM?

Your records on a microcomputer?

an introduction to filing packages

Maintaining records in files of various kinds has turned out to be one of the most valuable uses for a computer. In fact it's one of the most appropriate applications for the small computer. Files ought to be organised logically — they should be laid out in a standard format so that all records look the same: they should be arranged in a logical sequence, with a logical method of getting to particular records. And computers are good at following the kind of logical rules that will achieve those ends.

You should also be able to get at the information you need in a variety of different ways, and computers can be told to do that too — much more quickly and far more efficiently than by hand. What's more, you'll want to sort through your records and select some of them for further action: like overdue debtors in a file of sales records for a business, or all items for which you paid more than £5 in the files for your philately collection back at home. The computer can do that sorting and selection for you, and again it can do it quicker and more accurately than you can.

If you want to run a filing system on your computer you have three basic choices. You can use programs that have been specially written by you or someone else: you can buy very specific packages for a particular task: or you can look at general-purpose 'file management' or 'database management' packages.

The word 'Computer' is something of a misnomer in practice most computers don't do an awful lot of computing — not in the sense of performing mathematical calculations, anyway.

What computers are good at, and what they are generally used for in practice, is blindly following repetitive rules very quickly. The implications of this are simple if you have a task that can quite easily be seen as a collection of basic rules to follow, and if it is one that involves a tedious amount of effort for people to do quickly and accurately, the computer is the obvious choice.

That particularly applies to

the storage and use of information. Computers can store large amounts of information in a small space: they can store it accurately and in a consistent format: they can (in theory) let you keep it up to date easily: they can (in theory) let you get at it quickly and easily, presenting all the information you'd like in the format you want.

For that (as with all tasks on a computer) you'll need some software. In that case you will need something called a 'file management' or a 'records handler' or a 'database manager'.

You could write a special program to do that processing, of course. But file managers are geared to

the idea of working with files: a programming language makes no such assumptions, since not all programs will utilise files. It gives you instead a set of commands and rules that are more general in their application — and paradoxically much more specific in their effects, operating at a much lower level in terms of how they relate to the electrons buzzing around inside the computer.

You'd find it difficult to use a file manager package for tasks involving lots of computation on a limited amount of filed data. You'd find a virtually impossible to use such a package to handle readings being received directly from lab instruments or to control the operation of an automated production line. But nearly any programming language could be employed on those jobs.

Filing

▷ On the other hand, if you do have the kind of problem that requires information to be stored in files for subsequent use, you won't beat the file manager as a way of getting up and running quickly with a computerized solution. The details of the program's operation will be much less susceptible to errors and unforeseen pitfalls, since they are far more likely to be both predetermined (by the manufacturer) and tested in the field (by users).

And since the range of possible uses is known, the manufacturer does not have to include all the commands and functions you can and should expect from a general-purpose programming language. So the type of commands provided by the file manager can be much more explicit, much more relevant to the task at hand; and the terminology used can be more explicit, too, closer to spoken English.

The same arguments of course apply to other packages with a specific function — word processors and the so-called 'spread-sheet calculators' in particular. It is possible to use a programming language to produce programs that do the same jobs, and clearly someone did just that to write the packages in the first place.

But the advantages of those packages lie in ease of use and the speed with which you start getting useful work out of them. In view of that, it's worth making those two the main criteria when you come to select any kind of package.

What's a filing system?

At its most basic, a filing system is a program (or more likely a collection of linked programs) that allow you to set up your own format for records in a file — and to set up different formats for different files, too.

Subsequently the package gives you the facility to type information into those blank record formats, and subsequently to pick out

selected records or selected items for records, including summaries of all or part of the file using selected items.

You will probably be able to decide just how such reports and summaries are to be presented on the page.

One of the attractions of the filing packages is that the principles involved are so familiar. Everyone knows what a 'file' is, it's a collection of related information, that's all.

And files consist of 'records', which are fairly obviously individual items of a like nature that will be complete in themselves (holding all the relevant information you have on a particular customer, for

example) in a form that allows you to compare the information therein with the same kind of information held in other records in the same file.

Computerized files aren't quite analogous to the office filing cabinet, though. In one of those folders or suspension files you can put any kind of information that you regard as relevant to the name on the file — documents, correspondence, photographs, bills, news paper cuttings.

The computerized system requires you to set up a much more rigid format for records, and in practice each of the file entries therefore have to look much the same.

A better analogy is with a

card index, where the file consists of a bunch of individual cards (say personnel records) in more or less the same layout (name, followed by address, personnel number, date joined, current department, job history, etc) — but with the scope to add information that doesn't fit the rigid headings you've laid down, personal notes and managers' comments for instance.

Pros and cons

In short, filing packages are very flexible ways of handling the kind of information that you can keep in files. They do impose some structures, of course.

There is normally a limit on the number of headings you can have in your record format and there may be a restriction on the amount of information you can enter against each heading.

And you usually have to get your record format correct right from the start, since you generally have to specify the format in considerable detail — how many characters you want to allow for each entry, which items on the record you'll want to use for 'sort and select' tasks, which items you may want to pluck out and use in calculations.

Once you start entering the information it's often very difficult or impossible to change the layout. So it's worth taking a good deal of care and no little time to cover all the possible options.

There will be other restrictions as well. Some packages have a maximum number of records that you can put into a file though with many that's limited only by the capacity of your disks — and with some you can spread a file across more than one disk. Some also put a limit on the amount of information you can hold in any one record.

And with most of them, the size of the individual records relates directly to the maximum size of the file; all records have to be approximately the same

▷ size, because they are all laid out to follow your predefined format, so if you're using a long record format you will obviously take up more disk space per record.

The fancier packages do use clever techniques to minimise that. Instead of repeating all the headings on each record stored, they will use a kind of abbreviation form that clearly takes up less space, the full expanded form of the heading will be stored somewhere else within the file in a kind of glossary, and every time you want to print or display a record the program will go to the glossary to fetch the full heading.

Another advanced technique found in some packages is what's called 'data compression'. This is a way of concatenating repeated information, usually the spaces left over when an entry doesn't fill up all the room you have provided for it in your format. In a rigidly-defined format each of those spaces would have to be stored separately as one blank character, and a blank takes up as much room on the disk as a 'real' character.

Data compression would somehow store all those extra blanks as just one or two characters — a line of eight spaces, for instance, might be stored as just two characters, with one telling the program the number and the other identifying the repeated character.

Database v files

Many of the packages that will handle files for you describe themselves as 'database managers'. In fact the term should be reserved for packages that can legitimately claim a different order of sophistication.

A DBMS (database management system) is still a software package for creating, updating and manipulating information. But it quite deliberately aims to provide an environment in which a number of specially-written applications can

have access to a common pool of data without their needing to specify exactly how the data is stored and used.

In other words, a DBMS is designed to link with other programs, and it is designed to free the programmer from some of the nitty-gritty of data definitions. A full-scale DBMS generally requires a professional programmer to use it effectively.

This is not to say that DBMSs do not provide quite understandable and definitely useful commands for storing and retrieving information most of them do. But their complexity tends to bump up the effort and time required for learning, and their sophistication might well be wasted on the simpler routine file management jobs.

Do not exclude consideration of a package that calls itself a DBMS — not all self-styled database managers actually qualify for the description above, after all. But be prepared for the implications of using one!

What can you do?

So far so good. You've bought a filing package because you want to set up files. But you also want to get at those files, to use them. What kind of facilities will the package provide?

• Setting up records

For a start, the package will set up records. That is a fairly obvious point, but it is worth making. The computerised system will impose order on your record-keeping. It will force you to decide what kind of information you want to hold, and it will force (or at least encourage) you to fill in each record with the same kind of information in the same manner.

Some of the information might be entered automatically for you. When it's required, today's date is often inserted without your having to type it. If you have an entry in your supplier's record for 'outstanding

balance', say, the program might well be able to fill that in all by adding the last invoice total you put in to a current balance and perhaps subtracting what you've just keyed into the 'payment received' line.

Most file managers require that all records are identical in format and the same length. Those packages more properly called 'database management systems' may allow you more than one type of record in your files, though

• Maintaining Files

The filing system will also maintain records and files. New records can be added as they arise when information changes, existing records can be amended simply, quickly, accurately and rigorously.

Both factors mean your file should be as up to date as you can make it — and since amendments are fast and easy to do, with a defined procedure to the job, the sheer effort of keeping the files up to date should be minimised.

• Searching

Once you have your information in there you'll want to get at it. This means the ability to search for a particular record and display or print it. Typically you will want to get at a record by referencing the main subject on it, the supplier's name for example.

Or you might want to pick it out by using some kind of subsidiary information which doesn't happen to be at the top of the record layout — an abbreviated name-code or a customer number, say. Perhaps you can't remember the name, so you'll want the package to find you the record for that sales prospect in Whitehaven or the job applicant to whom you wrote on 11 January 1982.

All the packages allow you to do that, though they will usually require that you nominate in your initial setting up of the format which bits of information on the layout you might want to use for searches. These are

generally called 'key' fields, a 'field' being one of the entries in a record — files consist of records, records consist of fields.

In searching through a file like this the package will typically pick up all the records that appear to fit the information you've offered. You are likely to get a screen message telling you it's found four records with a Whitehaven address and do you want to see the first of them now?

• Browsing

When you have located one record, the program will probably let you look at the next one along in the file, most will let you go back to the previous one, too.

'Next' here means the next one in terms of your specification for the file. You might have put a company name as your main header, in which case the following record will be next in alphabetical sequence. But your main header might be a filing code or a number, in which case the sequence might be alphabetical or numeric (or a combination of those).

• 'Conditional' searching

When you tell it to look for 'Whitehaven', you're giving it just one parameter for the search. In fact all but the very simplest filing packages will pick records on the basis of a combined set of different criteria. You will probably be able to say 'find all records for reports and books on marketing thermocouples in the Middle East that we ordered in the past two years and which have a publication date later than 1980'.

The programs do vary in just how many different criteria you can use to locate the precise record(s) you're after, and they also vary in whether they let you use what are called 'operators'. The thermocouples example strings together a collection of ANDs, and AND is one of the 'logical' operators. NOT is another, so some packages would let you add '... and which have not been taken out of

the library by anyone from this department during 1983".

OR is another useful operator, extending this particular search for instance to say "that were produced by independent bodies within Europe or North America or Europe but not Switzerland".

A few packages can also incorporate arithmetic in the searches. Usually this means the 'greater than' and 'less than' operators, for instance to pick out all suppliers whose outstanding orders total less than £1,000.

Or you might have the program do the comparison between two items in the record itself. Say there's one entry for credit limit and another for current balance; you could tell the system to compare the two and give you a list of all customers who are running over their limit right now.

• Calculation

Actually performing arithmetic calculations on information held on a record is more likely to be of use to you when you want to produce reports or print something.

Not all the filing packages on offer will permit this; but those that do will let you add, subtract, divide and multiply (maybe even do exponentiation and other fancy maths) on specific fields.

This means your records might sensibly provide the basis for an invoicing system, for instance. The program can pick up outstanding customer orders from a file, automatically apply VAT and discount rates, calculate a total due, and add a note with the calculated discount for pre-payment.

You might also do some arithmetic on the file for business forecasting. You could have the program go through the records to pick out all unfilled advance orders for the next year and total the lot. Or you could ask for subtotals by product group and month due.

Depending how clever the package is, your fore-

cast could include information from more than one file — sales details from the customer records, purchases from another file for suppliers, production data from a third file of your manufacturing records. Some filing systems let you do this, totalling all the relevant fields and performing calculations on the results.

• Sorting

You will almost certainly be able to have the package re-sort all or part of the file. The records might be stored alphabetically by name; you might want them sorted into a 'date of last order' sequence, or by postcode, or whatever.

You can do the re-sorting by using any key field you

set up originally, and obviously you can combine sorting and selection to pick out only the relevant information.

• Pre-stored processes

Some combinations of search criteria and arithmetic processes may be used frequently. A few packages allow you to pre-define these and store them separately, in effect as mini-programs, so that you can call up the sorting parameters simply and quickly or insert a standard formula easily into records or reports whenever it's needed.

• Output

Once you have extracted

the information you want, you can print or display it. The trick is that as a rule you can set up the layout of this output quite independently of the way the records themselves look.

So your forecasting program can be arranged as a table with headings along the top and side and the information taken from the files inserted as numbers in the columns. Your invoice format would use the name and address fields from the record in one position and other data elsewhere on the page, adding some specific material like your standard payment terms. And so on.

The package will probably come with some predefined output format anyhow. Several have a built-in label-printing function, for instance, a layout that sorts sticky labels on this continuous sheets and just takes the name and address part from the records.

• Links to Word Processors

Word processing of some kind is another option now being encountered more frequently. A couple of packages have this built in, with all the facilities you would expect from a word processing package — plus the ability automatically to insert into your text selected parts of the records in a particular file.

That of course is very useful for form letters — personalised marketing mailshots in particular, statements and running letters as well.

For that you might not need a full-scale word processor, some packages give you a cut-down text facility in the form of a letter-writing option. There you might be limited to a single A4 page of text and be given fewer text formatting functions to play with.

A few packages in any case can be linked directly with one of the commercially-available word processor packages. □

THE ADMINISTRATOR

The original transaction processing system which can learn and run repetitive functions. It allows the user to create his own records and also his own menu for job selection. Widely used by all types of business.

All about assembly language programming

by David Pinless

The first in a series of several articles to lead you gently into the world of Ds and Is.

Ever wondered if you could bridge the gap between understanding Basic and Assembly Language Programming? Would you like to be considered a cult hero by your friends who are still mastering PRINT statements? If the answer to either of these two questions is yes, then read on . . .

Assembly Language Programming is fascinating, but unfortunately, you cannot begin to comprehend it until you have a reasonable grasp of the binary and hexadecimal number systems, which are a chore to learn. C'est la vie.

The decimal number system with which we are all familiar, can represent a number of any magnitude by combining as many as necessary of the ten characters

0,1,2,3,4,5,6,7,8,9.

A number larger than nine is represented by two or more characters which are interpreted according to

their relative positions. For example the characters in the number 3652 can be explained as follows

Thousands (10 ³)	Hundreds (10 ²)	Tens (10 ¹)	Units (10 ⁰)
3 x1000	6 x100	5 x10	2 x1
3000 +	600 +	50 +	2 = 3652

The binary number system on the other hand, uses only two characters to represent any number 0 and 1.

A number larger than one is formed by using two more characters, so that 1010 when converted to decimal, means ten.

Eights (2 ³)	Fours (2 ²)	Twos (2 ¹)	Units (2 ⁰)
1 x8	0 x4	1 x2	0 x1
8 +	0 +	2 +	0 = 10

The hexadecimal number system uses sixteen characters.

0,1,2,3,4,5,6,7,8,9,
A,B,C,D,E,F.

characters to represent it. Consequently SF when converted to decimal means ninety-five.

Any number larger than (you guessed it) fifteen will require two or more

Sixteen (16 ¹)	Units (16 ⁰)
5 x16	F x1
80 +	15 = 95

Diagram 1: Functional representation of the internal components of a VIC 20

Page Number		LOCATION Within Page		Address	
Dec	(Hex)	Dec	(Hex)	Dec	(Hex)
256	(\$FF)	255	(\$FF)	65535	(\$FFFF)

Diagram 2: The concept of dividing memory into pages

Decimal	Binary	Hexadecimal
1	1	1
2	10	2
3	11	3
4	100	4
5	101	5
6	110	6
7	111	7
8	1000	8
9	1001	9
10	1010	A
11	1011	B
12	1100	C
13	1101	D
14	1110	E
15	1111	F
16	10000	10
17	10001	11
18	10010	12
19	10011	13
20	10100	14

Table 1: The first twenty numbers in the three major number systems

Note: hexadecimal numbers are often prefixed by the \$ sign to distinguish them

vented by the presence (1) or absence (0) of electric current

The machine can only understand 0s and 1s, which might lead you to ask how it can cope with Basic, all will be explained

The microprocessor communicates with the memory by a series of wires known as buses. One of these, the address bus, has sixteen wires, and is used to specify the exact pigeonhole or location in which information is stored. If you know your powers of two (given that these wires know their way by the presence or absence of current) that means the microprocessor can address up to $2^{16} = 65,536$ locations

The data bus only has eight wires and is used to transfer eight bits at a time (i.e. the contents of one location) between the microprocessor and memory, in either direction. The most important wire

in the control bus specifies which way the data is travelling on the data bus — i.e. to the memory from the microprocessor, or vice versa. A write operation will overwrite the contents of a memory location; a read operation merely copies the contents into the microprocessor.

Since your machine only understands binary (and binary-coded decimal as well — see next article), as if that isn't bad enough, you will be wondering why you also need to bother with hexadecimal.

The answer is pure convenience

To illustrate this, consider the highest address in memory (65,535) and suppose it contains 11010110. The address could equally well be represented in binary (1111111111111111 — awful), or hexadecimal (\$FFFF), and the contents in decimal (214) or hexadecimal (\$D6). You can see that

▶ Having got that over with, you may care to cast your eye over Table 1 which shows the first twenty decimal, binary and hexadecimal numbers

Now on to something more interesting. The innards of your Vic can be functionally represented, at the simplest level, by something like Diagram 1 — a microprocessor and a memory

Innards

The microprocessor is the clever part, and the particular model in the Vic is called the 6502 (don't ask me why). This piece of electronic wizardry can understand in excess of fifty different instructions which is what Assembly Language Programming is all about.

The memory, whether it be RAM or ROM can be imagined to consist of a large number of pigeon holes one on top of the other, each of which in the case of your Vic will contain eight binary digits (bits). These bits are in turn repre-

Taking listings for Vic and 64 programs and routines direct from the printer means they come out exactly as they were originally programmed (though usually we renumber lines and add an introductory attribution).

But this obviously means too that the screen control codes, which appear in listings as symbols, have been printed as they stand... and this can cause you more than a few problems. You often have to look up the symbol in the computer's handbook to find out what it means. And the standard isn't not exactly the world's most precise printers; it is sometimes difficult to decipher exactly what the symbol in question is.

So all our programs have been run through a conversion program that substitutes for the screen control codes a more intelligible set of commands. These you'll find in square brackets within the listings.

When you see...	It means...	Yos type...
[ROM]	Cursor home	HOME
[CLR]	Clear screen	CLR (shift + HOME)
[INS]	Insert	INST (shift + DEL)
[CUP]	Cursor up	.
[CUD]	Cursor down	.
[CUL]	Cursor left	.
[CUR]	Cursor right	.
[BLK]	Switch to black	CTRL + 1
[WHT]	Switch to white	CTRL + 2
[RED]	Switch to red	CTRL + 3
[CYN]	Switch to cyan	CTRL + 4
[PUR]	Switch to purple	CTRL + 5
[GRN]	Switch to green	CTRL + 6
[BLU]	Switch to blue	CTRL + 7
[YEL]	Switch to yellow	CTRL + 8
[RVS]	Reverse on	CTRL + 9
[RVO]	Reverse on	CTRL + 0
F1	Function key 1	F1
F2	Function key 2	F2
F3	Function key 3	F3
F4	Function key 4	F4
F5	Function key 5	F5
F6	Function key 6	F6
F7	Function key 7	F7
F8	Function key 8	F8

▷ hexadecimal is much neater, and it is also very easy to convert between it and binary.

To do so, divide the binary number into elements of four, convert to decimal and then to hex

1101101	0101	binary
6	13	decimal
6	5	hex

Finally, let me explain the concept of dividing the memory into pages — hex comes into its own here. Imagine that the 65,536 locations are divided into 256 pages each containing 256 locations (256x256 = 65,536). Page zero will contain locations 0-255, page 1 will contain locations

256-511 and so on. Diagram 2 illustrates this with hex values. When you come to learn the memory map of your machine, and learn addressing techniques in Assembly Language Programming, this concept will prove invaluable.

The next article will delve more deeply into the

mysteries of the microprocessor itself, in particular its internal registers and how it interprets binary data. The first instructions in Assembly Language programming will be presented, and you'll realise you don't have to have a degree in computer science to understand it all! □

Machine Code vs Basic

by A J Morris

If you ever doubted the efficacy of machine-code programming, just try this clever little demonstration of

its speed on the Commodore Vic-20.

This program demonstrates the times taken to

print the 255 ASCII characters on the Vic's screen. The idea came to me while reading *Vic Revealed*: the chapter on machine code suggested that it runs over 100 times faster than Basic, so I decided to try and prove it.

Included at the end of the chapter is a program to print the full ASCII character set. I have had to modify it slightly to print the characters from the top left hand corner of the screen onwards (POKE location 7680 + 355) rather than printing at POKE location 7935. 255 towards the top left of the screen.

The results? The time taken is between one and

two 60ths of a second for machine code compared with three to four seconds for the equivalent Basic routine — and that is certainly over 100 times faster.

I hope this article will prompt other Vic 20 owners to consider machine code as an alternative language to Basic, perhaps with the aim of faster action games or sub-routines etc. Using a Basic loader routine to place machine code into the Vic's cassette buffer (192 bytes maximum) is a good starting point to teach yourself machine code on the Vic incidentally use SYS 828 with this method. □

Source Program

Source Program	Comments
LDA #0	Set up character value
STA \$0340	Initialise CHAR
LDX #0	Set Index Reg=0
LDA \$0340	Get 'CHAR'
STA,X \$1E00	Store at start of video RAM + index
LDA #2	Set colour to red
STA,X \$9600	Store colour in colour RAM + index
INC \$0340	Put next ASCII character in 'CHAR'
INX	Point to next screen location
CPX #0	Location — last character?
BNE	If no, repeat until done
RTS	End

OUT NOW! 811 IDEAS FOR YOUR COMPUTER

NEW
BASIC-AND
BASIC-BOOK

In this book, you'll get 811 ideas for your computer. It's a book that is in the latest state for you.

Cables, cables and more cables! How to make, use and buy cables. How to choose the right EIA RS-232 extension cables for your VDU's and how to connect your Apple Commodore or other micros to Quase Datalog NEC printers. Compatible cables for connecting new peripherals to your DEC Data General Hewlett Packard IBM Osborne and Tandy computers.

Literate European based about Inmac, i.e. the floppy with a Machine program. Choose from our range of 100% error-free disk cardrivers. Plug-free disk packs.

each with a 3 year replacement guarantee.

New Ideas! Dozens of exciting new products — many never seen in Europe before now — and lots of helpful hints on getting more from your computer department.

Service and Quality — a promise you can rely on! We promise a next day delivery service of our products, a 30-day risk-free trial and a 12-month trouble-free quality replacement guarantee.

Send today for your FREE, at no charge with no obligation to purchase but be warned, you will want to buy ones you have read the Inmac catalog — a dealer's book!

EPROM PROGRAMMER MK3

This advanced version of our Mk2 Programmer will program the popular industry standard 2516, 2716, 2532, 2732, 2564, 2764, and 27128 EPROMs. Disk-based software with all the essential functions for fast and reliable EPROM programming. 14 functions including Check Empty, Program, Verify, etc. plus 6502 Disk Assembler and Assembler Hex-File loading (CBM or JCL Assemblers). With built in power supply and new custom case, this is the Programmer Commodore use at Slough! Price £299 including 2716 personality card.

IEEE BUS-ADAPTOR FOR VIC 20 AND CBM 64

A superior adaptor at a reasonable price. This brand new item allows you to use standard CBM/PET IEEE disk drives and printers with your VIC or 64. Many advanced features including:

- ★ MINI-DOS support
- ★ Selectable default device number for load/save
- ★ Batch file loading
- ★ Multi user bus sharing and simultaneous use of the serial bus.
- ★ Gold-plated edge connector for long term reliability

Supplied with instructions detailing these features plus many more. Price approx. £59

JCL SOFTWARE
47 London Road, Southborough,
Tunbridge Wells, Kent.

BUSINESS ROM and JCL ENHANCED BASIC

The Business ROM is available for the 4000/8000 series machines, and adds 25 additional keywords to your BASIC. Your programs will be easier to write, faster, more reliable and more powerful. Super screen management and input systems coupled with efficient easy-to-use relative file handling... and more. Used by many major UK companies who require the best.

Now the new JCL Enhanced BASIC ROM for the 700 series has even more facilities than the Business ROM, including fast memory transfers and special screen designing functions. Price of Business ROM £120

ROM PAGER BOARD

The ROM-Pager is a small board that fits neatly inside 4000 or 8000 series machines. Fitted in seconds (it just plugs in) it provides 8 spare ROM sockets for extra ROMs or EPROMs. Simply call the ROM you want with a POKE. Two versions available, and both leave the USER PORT free. Price £45

ROM Pager 4E4 allows 2 banks of 4 ROMs to share two adjacent sockets. Price £47.50

Phone 0892-27454
for data-sheets or
more information.

JCL Software: Stand 26

SUPERCLERK: Stand 27

SUPERCLERK

FOR COMMODORE COMPUTERS

There is a lot more to SUPERCLERK than this!

Besides the Typing and Filing functions, there are many useful functions like Backing up disks. Also, you can PAUSE in the middle of typing a letter or editing a file, and use some of the many 'commands', and then instantly return to what you were doing. These 'commands' allow you to do things like print the screen, save the screen on disk, use the TYPEWRITER or CALCULATOR or Electronic Jotter functions, etc. etc. The programs are written in a unique Business BASIC and you can even use this to add new functions to SUPERCLERK and write your own programs. Much easier than standard BASIC. Programs run as fast as most compiled programs.

Price so far — £395 for this basic package

But there is a lot more. For under £200 a time you can add Nominal/Sales/Purchase Ledgers/Payroll/etc to help run any small business. These account functions are incredibly simple to use, and will automatically print the compulsory reports (daybooks, VAT, etc) at the end of the month. But you can also use all the Typing and Filing functions to examine or print anything from the account files (eg. a letter to all customers who have spent more than £500 with you this year and who live in London). Incredibly flexible Password protection to restrict access to confidential files.

If you have an 8032 or 8096 (or are considering buying a new computer), then send for details now, or contact your local Commodore dealer.

SUPERCLERK is ideal for beginners — but has many advanced features (plus the fact that you can alter it) and can change or grow as required.

SUPERCLERK is an exciting new package for the Commodore 8032/8096 (and soon the 700 series) Computers. Start with SUPERCLERK's Typing (we think it's the easiest to use word-processor that we've seen) and Filing functions (simple database system for storing information in files). Use the wordprocessor to design the layout of a file, use the Filing system to store some names and addresses, then select certain names using MATCH, Upper/Lower LIMITS IF/THEN criteria etc. and then get SUPERCLERK to type a letter to the selected people, automatically inserting information from the file into each letter. You can also use the Filing system to type reports with totals, or address labels, etc. from the information contained in the file. You should have done all this within an hour of starting to use SUPERCLERK — it really is designed for idiots to use, and assumes you know nothing about computers. No training courses required. (But the extensive manuals provide many examples). Most people will not use the manuals because you can ask SUPERCLERK for 'HELP' at any time — have as many help screens as you wish.

Superclerk Ltd, 129a Market Street, Chorley, Lancashire PR7 2SG Telephone: 02572 78376

Structured

programming in Basic

What is it?
Who needs it?

by Chris Preston

The problem with Basic is that it's too easy. You don't have to do too much thinking before you can get started on writing your program; and this means it's tempting to do your thinking actually while you are writing. So you can add new steps as they occur to you. If they don't fit in the sequence of instructions that you happen to be working on at the time, you're always got the mighty GOTO statement: that can switch the program away to some other point where you can put the addition. Then you use another GOTO to get back to where you were.

So what's wrong with that? Well, the seductive GOTO can produce a real mess. If things aren't proceeding in a tidy, natural sequence, there is a very good chance that confusion and error will be the results. Or the program may actually run: but with all that jumping about it will be extremely difficult for anyone to understand just what is going on — and it's likely that one day you or someone else will want to amend the program somewhat, so you'll have to be able to figure it out.

GOTO is the prime example: but it isn't the only statement in Basic which encourages such sloppy and dangerous programming habits, and Basic isn't the only language that includes them.

And what's the alternative, then? Let's hear a big hand for 'structured programming'. Massive textbooks have been written on this subject: but structured programming comes down to the desirability of applying some forethought and some method to your program-writing.

'Structured Programming' is a term which is heard more and more often these days, as more trained programmers appear on the micro scene (as opposed to those who picked it all up themselves from the Commodore manual).

It is claimed that structured programming is the only correct way to write programs, and Basic is damned as being "too unstructured". Instead we are told to use PASCAL or COBOL. "Ban the GOTO statement" is another war-

cry of the structuralists, one which (not unnaturally) frightens many people away from using structured programming techniques.

[I do not claim to be a rigid structuralist, and many of the comments I make in this article will seem like sacrilege to more orthodox programmers. But I hope that I can tempt some readers into using some structured methods rather than writing totally amorphous programs. In fact, many of my recommendations fall

more into the heading of "general good practice", especially as Basic is not a structured language.

We can split this article into two main sections. The first will look at applying structured techniques at a high level, by separating a program into distinct sub-programs and subroutines. The second part takes a close-up view of a structured program, looking at smaller program segments such as FOR-loops.

But before all this, just what is structured programming?

What I mean by 'Structured programming' is really just writing a program in a controlled, logical way — rather than just writing line after line of code in one long jumble. The basic idea is to make the program easier to understand, and hence easier to debug and alter.

This often means putting in extra statements, which may not be the most efficient way of writing a particular program segment: but 99 per cent of the time the difference in program speed and size is much too small to be noticeable.

It also means that the early stages of writing the program, as far as the initial testing phase, will take longer. The bonus however comes when you come to try and find out why the program just will not work,

because the testing and debugging then will take much less time than before.

Getting started

The first stage to writing a structured program (as ideally, for any other kind) is planning and flowcharting. Even at this stage, we should be thinking in terms of 'blocks'.

If we are writing a Space Invaders game, for instance, one 'block' might be to draw an alien on the screen. We would write this as a subroutine, which is called by the main program and takes two parameters X and Y that specify whereabouts on the screen the alien is to appear. In a more complicated subroutine we might have extra parameters specifying the alien's colour and shape, perhaps.

In this case most people would use a subroutine to draw the alien away: it is an operation which is going to be repeated many times in the program. It is often good practice though to put things into subroutines even though they only occur once in the program. This procedure has many advantages:

• The operation is moved out of the main program and so does not clutter things up — which makes it easier to follow what is happening.

Programming

▷ • The operation may be quite common even though it is only used once in any particular program. A typical example is inputting and validating a date. The subroutine can then be stored separately in a 'library' and merged into programs as and when required.

• It is surprising how often 'once-only' blocks in fact turn out to be needed more than once after all! If the block is already written as a subroutine, it is very easy to put in another call somewhere else in the program.

There are also many cases where common operations can be put into subroutines — printing a line on a printer, for example, or opening a disk file. In fact, some people say that all input and output should be done as subroutines!

If all printer output is done by means of a single subroutine, it is easy to change this to make a change such as redirecting all the output to the screen or a disk file for testing purposes. Similarly, a disk output subroutine can easily be changed to put all disk output on to the screen.

We must be careful not to go too far in this. I once saw a stock control package produced by quite a respectable company, where the 'main' part of the program was simply this:

```
1000 GOSUB 20000
1010 GOSUB 21000
1020 GOSUB 22000
1030 GOSUB 23000
1040 GOSUB 24000
1050 GOTO 1010
```

Not really structured programming!!

Still on the subject of subroutines, it is a good idea always to make sure every subroutine has only one RETURN statement even if this means that you have to add some extra GOTO statements. For example we should replace this:

```
1000 A=1: RETURN
1010 .....
1020 .....
1030 RETURN
```

with something like:

```
1000 A=1: GOTO 1030
1010 .....
1020 .....
1030 RETURN
```

This is because it often happens that we want to make something happen after the current subroutine has finished, increment a counter say. If the routine has only one exit, it is easy to add an extra line. It is not so easy if there are half a dozen scattered all over the place.

In the above example we could add a statement simply, making the end of our subroutine:

```
1030 PL = PL + 1 :  
RETURN
```

These days many new micros which offer disk drives have some sort of 'chaining' facility which allows you to move from one program to another without losing all your variables. But even for those that don't, a well-publicised trick is usually available.

No excuse

This being so, there is no excuse for having huge programs most of which is only used once in a blue moon. Such a program should be split into smaller, more manageable chunks which load more quickly, take up less memory and so (in Basic anyway) run faster and which are in any case easier to test than the original monster. Remember what happened to the dinosaurs?

So if large parts of your program (such as file creation) are used only rarely, put them into a separate program.

Once you have done this each section of your program will be quite small, so you will have lots of room for adding comment. Only rarely is lack of memory an excuse to leave out REM statements; they really are invaluable when you pick a program up again six months after writing it to make some changes. To paraphrase the TV advert "Don't cheat on the REMs!",

Structuring in practice

Now we come to the second part of the article, looking more closely at how we actually write structured code.

This is the bit which is difficult in most Basics, which lack WHILE and REPEAT statements and where the IF statement is limited to a single line.

Structured life is much more simple if you can write **IF A = 15 THEN** do some code **ELSE** do some other code and finally **PRINT A**. But most Basics insist you do something like this:

```
1000 IF A < 15 THEN
1200
1010 .....
1020 .....
1030 GOTO 1400
1200 .....
1210 .....
1400 PRINT A
```

The only firm advice which can be given is to **THINK** about your blocks. Very often a complicated group of IF statements can be simplified by changing the conditional. Take this simple example:

```
1000 IF A = 15 THEN
1200 GOTO 1200
1100 PRINT A
1200 .....
```

It could become:

```
1000 IF A < 15 THEN
1200 PRINT A
1200 .....
```

This brings us to the thorny problem of the **GOTO** statement.

Goodbye to GOTO

In making that structural change, we got rid of a **GOTO** statement in the action part of the IF statement in line 1000. Some programmers would say that a program should not contain any **GOTO** statements at all, and that computer languages should not allow such a statement!

Personally I think this is not feasible in Basic. But it is certainly true that if you write your code in a logical way you will find that you use fewer **GOTO** statements, so this is a sort of test as to how 'good' your program is.

Still, I wouldn't bother spending all night just trying to get rid of one more **GOTO** — unless you just happen to like hard work of course!

As mentioned above, it is a good thing to make sure that each subroutine has only one **RETURN** statement: similarly, each **FOR** loop should only have one **NEXT** statement. It does make the thing a lot easier to understand, and it is also simpler to add in another statement before the **NEXT** if there is only one of them. Also, there is always the chance that you will want to transfer the program to another version Basic which only allows one **NEXT** for each **FOR**.

One of the fundamental principles of good programming of any sort is that you do not try to do everything by the quickest/shortest/most awkward way you can find. This sort of thing always sets my teeth on edge:

```
100 X = Y - (Y = 15)
What I was saying:
100 IF Y = 15 THEN X = X + 1
```

If you forget about making each statement or loop as fast as possible and concentrate instead on arranging them *logically* — which often means *simply* — you will find that your programs are much easier to debug and update.

Once the program is fully tested, then you can start looking at bottlenecks; and there you may have to sacrifice a bit of readability in order to make the program perform respectably.

But in almost all of the cases where you have a choice between an *efficient* way and a *readable* way, your choice will have no noticeable effect on the program speed. So why worry about it? Write clear, logically laid-out programs, and you will save more time in program development than you lose in running a program which is maybe 0.05 per cent slower. □

IBM 80 CARD

Expand the capability of your IBM PC with our CP/M 80 processor card

- True CP/M 80 not an emulation
- Built in Corvus hard disk interface with multi user capability
- Drive M utility makes RAM behave like a super fast disk drive
- Files generated under CP/M 80 and 86 are identical in structure and are interchangeable between operating systems
- File transfer utility between PC DOS and CP/M Mz 4MHz version £299
- 6MHz version £335

PET CP/M

£495

The **SOFTBOX** allows the PET to run under the world's most popular operating system CP/M80

- Built in RS232 and CORVUS hard disk interfaces
- Operates with any 2000, 3000, 4000, 8000 system
- 780cpu running at 4MHz with no wait states
- 64K RAM full documentation free copy of CP/M80
- Will run any standard CP/M 80 software

IEEE-488 INTERFACES

B300

Bi-directional IEEE-488 RS232 interface 40 char input buffer full handshake etc etc £186

C100

Unidirectional IEEE-488 to RS232 £120

A100

IEEE-488 to Centronics/Anadex Parallel £106

GPI 1000

250 based bidirectional IEEE 488 to RS232 with up to 198k input buffering £275

GPI 50

A version of the GPI 1000 configured as an RS232 controller for the IEEE 488 bus £475

TV/VIDEO interface

Reproduces the content of the pet screen on a TV or video monitor £46

RS232 to 70 Ma current loop adaptor £25

PET HARD DISKS

£495

The **HARDBOX** is the intelligent Controller that lets you add a CORVUS hard disk drive to your Commodore computer

- PET DOS 1 and 2 compatibility
- Multi User capability with file and record locking passwords
- 6 Mb max file size and up to 65535 records per relative file
- 2000 files on 6Mb drive
- Access to 6 10 20 Mb drives with video tape backup

SIRIUS/VICTOR 9000 CARD

The card now being manufactured under licence by Sirius Systems Technology allows the Sirius/Victor to run any standard CP/M 80 program without modification

- Specification as per the IBM 80 CARD
- 6MHz version £365

DEVELOPMENT TOOLS

8048 Emulator in circuit emulator £1100

8748 Programming card £395

Cross Assemblers for most popular microprocessors £125

T 485 S100 to IEEE 488 controller card £385

CalcResult™

3-D Budgetting out of this world

Spread sheet programs have been available for a number of years. The knowledge and experience gained through the use of these led to a demand for a tool that is easier to use, easier to understand and more powerful than contemporaries. The result is CalcResult — a powerful yet low cost '3D' spread sheet for the Commodore 8000 and 64.

- * Three dimensional format
- * Up to 32 pages with consolidation
- * Horizontal and vertical page split
- * View part of up to 4 pages at one time
- * Powerful editing facilities
- * Compare budgets with "What if..." facility
- * "if... then... else" choice of calculation
- * Graphics output on screen and printer
- * Miserly use of memory
- * 'Help' functions on screen
- * Multi user capabilities and hard disk support
- * Ability to load VisiCalc™ files

Machine capability

CalcResult is currently available on Commodore Business machines as follows:

8032 and 8096 computers — including the SK series — on 8250 or 8050 disk units. It can also be used in multi-user situations and with Commodore 9060 and 9090 hard disks.

Commodore 64 — a single disk version for the 1541 disk unit, and serial printer.

Price

For 8000 series £149 (plus VAT)
For Commodore 64 £109 (plus VAT)

THE 4TH INTERNATIONAL COMMODORE COMPUTER SHOW

Cunard International Hotel, Hammersmith, London. 9-11 June 1983.

Hello and welcome to the Fourth International Commodore Computer Show. This year's Show is bigger and better than ever before. Over 100 exhibitors will be displaying their wide range of Commodore 'approved products' including the proven and established range of micro-computers and software for the business and the home.

One of the highlights of this year's Show will certainly be the UK launch of the Commodore 64 portable computer and the new Commodore 700 series business computer with CP/M and MS-DOS.

All three days are certain to be fun and filled with plenty of things to do including seminars, displays and demonstrations. Over 15,000 visitors are expected this year and over 18,000 square feet of exhibition space should easily and comfortably accommodate them!

The Commodore Computer Show is the only one of its kind held in Britain each year and represents a unique opportunity for the eager enthusiast, businessman or the whole family to discover the exciting world of micro-computing.

Yours sincerely,

Ian Slater
Show Organiser

THE 4TH INTERNATIONAL COMMODORE COMPUTER SHOW

How to get there

Hammersmith is in West London, of course, which makes the place pretty convenient from just about all directions except East Anglia and North East London. Driving there isn't too bad; the public transport services are excellent.

Cars

Getting to the Cunard International Hotel can appear daunting and is the subject of numerous apocryphal stories about haggard drivers circulating feverishly around the Broadway looking for a way to it. But in reality it's not too difficult.

The main hotel entrance is in Shortlands, and that's a two way road connecting Talgarth Road and Hammersmith Road.

Coming from Earls Court and Central London you aim for the A4 and follow signs to Heathrow, Bristol etc until you reach the Hammersmith flyover otherwise the next possible exit is a couple of miles further on. So get into the left-hand lane and take the side road signposted 'Hammersmith'; and at the next opportunity, turn right and make a U turn under the flyover. That puts you briefly on Talgarth Road going the other way, Shortlands is the first left.

Coming from Kensington and the West End, drive through High Street Ken and past Olympia. You're then on Hammersmith Road without trying; Shortlands is the last turning on the left before you

reach the ugly longsize roundabout at Hammersmith Broadway.

Coming from the West you stick with the A4 until you're offered the Hammersmith and Shepherd's Bush exit just before the flyover. Again, don't miss it: it's tricky to find your way back again! You follow the slip road on the Broadway, go right round the roundabout past the tube stations, and don't aim for Kensington — it might look the obvious route from the map, but there's no right turn into Shortlands from that direction. Instead take the next exit signposted 'Central London'. This puts you on to Talgarth Road and Shortlands is the first left.

Coming from Shepherd's Bush and the North you aim for the Broadway, avoid the temptation of the Kensington direction, and follow the Central London sign again with Shortlands the first left.

Car parking is in theory available at the Hotel itself — there's an NCP car park under it — but most of the space is likely to be taken by exhibitors and the Hotel's regular guests.

There are two other decent size car parks locally: one is off Queen Caroline Street (get on to the Broadway and take the exit after the Odeon), the other is behind the new shopping precinct called Kings Mall (take the King Street exit from the Broadway and follow the signs around it — it's about five minutes' walk from the hotel).

Alternatively you might just be lucky and find a space in some side-street. Your best bet is probably in the maze of streets just North of Hammersmith Road.

By tube

This is the obvious way to come if you live near a Piccadilly, District or Metropolitan Line station. On the Piccadilly and District lines you look for the 'Broadway' exit from Hammersmith station, turn right past the Clarendon pub and search for the subway that gets you under the Broadway itself.

The Metropolitan Line exit is on the North side of the Broadway, so turn left and brave the traffic at the foot of Shepherd's Bush Road and

try for the island of office buildings which also contains the Cunard.

Hammersmith is served by dozens of buses, too.

Leaving by cab

If you need a taxi, you'll probably find some at the hotel or will be able to flag one on the Broadway. But there is also a cab rank on the corner of Shortlands and Hammersmith Road, and there's another at the junction of the Broadway and Hammersmith Grove.

Making the most of Hammersmith

The sporting option (and others)

Bit frivolous, thus, but if you fancy spending some of your pent-up energy by combining computers with physical enthusiasm you could try the squash club next to the hotel (pretty reasonable rates, but it gets heavily booked) or the very smart swimming pool a short jog away at the optimistically named Lillie Road Fitness Centre. And for addicts there's a 24-hour snooker club opposite the Church on Hammersmith Broadway, more pleasant for hot early-summer afternoons might be the public tennis courts nearby in Brook Green.

And if you are inclined to mix your pleasures, there's always the Hammersmith Odeon — extra-large touring venue for over-hyped rock bands — or the Hammersmith Palais ('The World's

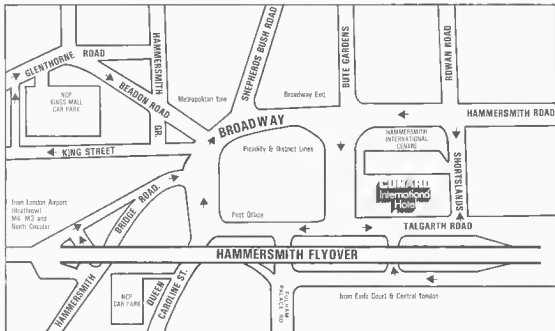

Most Famous Ballroom' alongside 'The World's Most Famous Nightspot'). The ABC cinema in King Street (three screens) gets first-run films. And two of the best little theatres in London are local — the Riverside Studios in Crisp Street, just off Queen Caroline Street, and the Lyric in King Street. nor is the Bush Theatre on Shepherd's Bush Green too far away.

Shopping

King Street has most necessities, including a newish pedestrian precinct 'shopping mall' and a very good Marks & Spencers. A big Boots, too, which may be needed if your Show-going demands extra paracetamol and foot refresher spray.

If the Show has fired your desire and you want to take a look at real computers that are really for sale, you can

John

find Vics at Boot's (King Street), Duxon's, WH Smith, and the Co-Op (those three are all in King's Mall, the shopping precinct). Duxon's for one will have 64s too.

Sustenance

There's a bar and a coffee/snack bar upstairs at the Show, and the Hotel itself has a couple more bars. You might however prefer to find your virtuals outside the place, in which case allow us to suggest.

Hammersmith Grove Market: small but ok for fresh fruit, and there's a couple of sandwich places there. For good value in the sandwich line try the foyer of the tube station.

Clarendon Hotel: not a hotel, just a pub on the Broadway near the tube. Good for lunch (ok shepherd's pie at £1.50). But go into the wrong bar and your drinking companions will be time-

warped punks and other strays

Swan: good pub on Hammersmith Broadway, across the road from the main tube entrance. Snacks, naturally.

Martin's: wine bar on Hammersmith Road near the hotel. "Office chuc" said our legman researching the area.

PJ Wine Bar: vaguely Tudor decor, uninspiring atmosphere, but handily placed in King Street.

Lyric Theatre: our personal preference — wine bar (kids ok) and pleasant food on one of the upper Booms of the theatre building on King Street, with terrace open on fine days. Nice place, through replete with exhibitions and exhibitionists. Spot the star!

Riverside Studios: food and drink in the other local theatre (Crisp Road) — even trendier, but eats are even

better value

The Chancellors: another short walk to this pub on Crisp Road off Queen Caroline Street — witty motto over door reads 'Cognitabum ergo eram'. A real West London backstreet local much frequented by non-locals from the nearby Riverside Studios.

Queens Head: pub next to the tennis courts and grass on Brook Green, worth the five minutes' walk. Beer garden, good reasonably-priced restaurant.

Laurie Arms: bearable pub sandwiched between the two arms of the Palace on Shepherd's Bush Road, distinguished by cheap food (eg shepherd's pie 80p).

The Builders: Young's beers in a lively local off King Street.

Solution Inn: extraordinary Fuller's pub on King Street — tiled facade, funeral flowers, 1950s

decor, Irish predominant atmosphere a-plenty

Short and pleasant post-show pub crawl (attested): start at *The Chancellors* in Crisp Street, then make for the Thames (very close) and walk upstream via *The Blue Anchor* and *The Rutland* — mayhap you'll stop to ponder the unlimpid waters below, in which case you might as well take some refreshment. Follow the river round to *The Dove*, an intimate and well-preserved pub with excellent food and a river terrace (it's an 18th century building once owned by the Duke of Sussex, who called it his "smoking box"). Next door is William Morris's old place and the 'Sons of the Thames' boathouse — it's all very English around here. A bit further on you'll find *The Old Ship Inn*, with beer terrace and boating paraphernalia.

THE 4TH INTERNATIONAL COMMODORE COMPUTER SHOW

Alphatronic Microprocessor Applications Ltd Stand B31/C32

Alphatronic will be launching new high-resolution light Pens for the Vic-20 and Commodore 64. These technically advanced instruments add to an existing range of high quality light pens for the 3000, 4000, and 8000 Commodore Pens.

Alphatronic will be demonstrating the use of the 18 series pen in the application psychometric tests.

Also on show will be a new range of tailored dust covers for the Commodore 64 and Vic computers and their complete range of accessories.

Alphatronic Microprocessor Applications Limited, Silbury Business Centre, 358 Silbury Boulevard, Central Milton Keynes MK9 2LR Telephone: 0908 663906 Contact: Mr. C.R. James

Anagram Systems Stand B40/C41/B42

Business Software for Commodore Computers - all Commodore-Approved

• For the 8000 Series: Integrated Accounting System; Integrated Accounting System with Product File, Integrated Accounting System with Stock Control, Sales Ledger with stock control, Sales Ledger with invoicing & Nominal Accounts, Sales Ledger with Invoicing, Purchase Ledger with Nominal Accounts, Stock Controller

• For the 700 series: Integrated Accounting System with Product File, Integrated Accounting System with Stock Control, Stock controller

• For the 64: Sales Ledger; Purchase Ledger, EASY-STOCK.

All 8000 and 700 Series packages are available on hard disk. The integrated Accounting System with Product File, Integrated Accounting System with Stock Control and Stock Controller are also available as multi-user systems.

Anagram Systems, 60A Queen Street, Horsham, West Sussex RH13 5AD Telephone: 0403 50845/58153 Contact: Richard Hall.

Anirog Software Stand B124

The name Anirog is well known in the computer entertainment business, particularly for its Vic range. **KRAZY KONG** and **XENO II**, both for the 16K expanded Vic, have received universal acclaim from all quarters. Programs such as these have established our reputation as the value-for-money software house. We have followed these two huge successes with another two big games for the 16K expanded Vic owners, **GALACTIC ABDUCTORS** which uses the full TV screen with stunning effects; and **3D TIME TREK** which has superb 3D graphics with arcade action.

There is a new game **PAINTER** for the unexpended Vic. Following our graphical adventures **PHAROS'S TOMB** and **ZOK'S KINGDOM**

we have brought out the first in a series of text and graphical adventures in the vein of *Dungeons and Dragons*.

Not forgetting the CBM64 we can now offer **3D TIME TREK** and **FROG RUN**. Both games offer extra features over and above the Vic versions.

ASK Ltd Stand B125

ASK is a leading producer of educational games for the Vic-20 and Commodore 64, enabling children to use their computer for something more than space wars.

Founded by Tom Stonier, Professor of Science and Society of Bradford University and author of the recently published and much discussed book on the computer revolution *The Wealth of Information*, ASK is a unique team of working teachers and professional programmers.

So far ASK has produced ten programs for 3-12 year olds. They supplement what children eventually learn, or are learning, at primary school.

HONEYFOLD

Each tape contains a complete 6502/6510 Assembler plus a BIN/BCD/Hexadecimal tutor.

This self paced course takes you from the absolute beginner in Assembly language, through the whole 6502/6510 instruction set and, as the press reviews have said, these are the FIRST books really written for the beginner.

From the earliest chapters your programs will run as the book is written to suit the purpose-designed assembler. Just to nurse you through these early stages the tape contains a complete binary, binary-coded decimal and hexadecimal tutor.

The chapters will tell you about:

- How to get started.
- Conditional and unconditional jumps.
- Setting the flags.
- Screen displays.
- Timing things.
- Mathematical operations.
- Labels, memory labels and macros.
- Saving loading and printing machine-code programs.
- Interrupts, overflow and break flags.
- The USA command.
- Floating point numbers.
- The 6502/6510 instruction set.

• And last but not least...

Just to check that you are on the right road, each chapter has numerous exercises, all of which are explained in full – at the back.

Each book is a bargain with a complete 6502/6510 reference text, a full assembler and a book that the beginner will understand.

Available from all good computer and bookshops or direct from Honeyfold.

THE 4TH INTERNATIONAL COMMODORE COMPUTER SHOW

in the basic skills of language, mathematics and problem solving

Programs such as **Facemaker** and **Words**, **Words** improve reading, spelling and observational skills through games which are fun to play and substantially challenging to engage a child's attention

Very young children will be intrigued by **Shape Up** and **We Want to Count** and the easier levels of **Ride and Seek**, which is quite a challenge for all at the higher levels

Number Pazzler, **Chaser** and **Gulper** are great games for everybody wishing to improve their mathematical skills — they even give adults a hard time

All the programs make good use of graphics, sound and colour and are designed to give encouragement and reward to players. They require 6K or 16K RAM pack capacity. They retail at £8.95 including VAT or £9.50 including p&p direct from ASK

ASK Ltd, London House, 66 Upper Richmond Road, London SW15 2RP Telephone: 01 874 6046 Contact: Peter Lever

Audiogenic Ltd Stand: B101/102

Audiogenic the leading independent supplier of software for the Vic-20, has extended its operation to encompass the Commodore 64. A wide range of software for both machines will be on display including

a Commodore 64 — **Wordcraft 64**, the 64 version of the phenomenally successful Wordcraft word processing system. Wordcraft 64 is the ultimate word processor for the 64! Written 100 per cent in machine code, Wordcraft 64 incorporates all the well known features of Wordcraft and takes advantage of the larger screen format of the 64 to give greater readability.

Motor Mania a thrilling cross-country car race game on cassette, in which the player has to avoid hazards **Motor Mania** is a powerful demonstration of the Sprite graphics capabilities of the 64

Renaissance, the 64 cassette version of the best selling Vic

cartridge game, **Renaissance** is the state-of-the-art Othello board game.

Grandmaster the strongest chess game for home microcomputers, **Grandmaster** has a wide range of facilities.

Forth, written by Dave Middleton, **Forth** is a powerful and flexible structured language, ideal for those frustrated with the limitation of Basic who are not yet ready for esoteric languages.

Monitor Audiogenic's 64 Monitor takes the misery out of machine code. Completely transparent to other programs, **Monitor** contains standard TLM commands plus a wide range of features including a Centronics interface, allowing the 64 to communicate with many of the high quality printers.

£ Vic-20 — included in the Vic software on display will be

Apple Panic: successfully carries over the many graphics and features that contributed to the game's popularity in the arcade

Chopflifer the officially licensed Vic version of the best-selling Atari game by Broderbund Software, **Chopflifer** has already taken the States by storm and is set to become a second 'Space Invaders' The game revolves around a helicopter which has to rescue fighting units from a battlefield. A total of four groups (64 commands) must be saved. The game sounds easy, it gets more dangerous with each flight

Home Applications: a range of six home application programs designed to bring the Vic-20 into the home as more than a games machine. Packages include **Car Costs**, **Loan Analyser**, **Home Inventory**, **Decision Maker**, **Household Finance** and **Home Office**

Audiogenic Ltd, PO Box 88, Reading, Berkshire Telephone: 0734 555647 Contact: Martin Maynard

Automation Facilities Limited Stand B5

Commodore Business Machines, like all well-seasoned travellers, could fall prey to

foreign hazards: so it's just as well that a special cleaning kit, the AF Pet kit, is supplied at the start of their journey — to keep them working perfectly however hot, statically charged or dusty their new environment turns out to be

The AF Pet kit contains **SAFECLENE**, a tape drive cleaning fluid, **SAFETWIPES**, lint free cotton squares, **FOAMCLEAN**, aerosol cleaner, **SAFEBUGS**, cotton bud sticks for keyboards, printers etc, **SAFECLOTOS** cleaning cloths and **SAFEGLENS**, VDU screen wipes

Also contained in the AF Pet kit is **FLOPPICLENE**, a disposable flexible diskette head cleaner, **FOPPCICLENE** features an open ended jacket which enables a fresh cleaning disk to be used for every cleaning operation. The risk of head recontamination and abrasion is completely eliminated. Faultless data capture and transmission is assured

The Pet kit is one of our comprehensive range of AF computer cleaning products

Bubble Bus Stand B118

Bubble Bus is the newly-formed division of The Computer Room, a company which has been creating approved software for Commodore business applications.

Bubble Bus is devoted to creating and marketing a wide range of top quality products for the Vic-20 and CBM 64, including games, educational and business programs. Bubble Bus programs are already sold by many dealers in the UK and in countries overseas. Fifteen new products for the Vic-20 and eight for the CBM 64 will be on show — including the top selling 'Extremator' on the Vic and 'Pool' on the 64. Software may be purchased on the stand where you can also enter our special show competition.

Bubble Bus, 87 High Street, Tonbridge, Kent. Telephone: 0732 353982. Telex 95151. Contact: Jo Fisk

CDS Ltd Stand B121

CDS has spent a large amount of time and effort in designing and manufacturing micro computer furniture. The result is the Executive Desk, ideal for the go-ahead executive who wants to maintain his image and his micro; there is also the Micro Tidy which houses the Vic and CEM 64, hiding all the wires and at the same time acting as an attractive item of household furniture. Both are made to a very high standard at a competitive price.

CDS Ltd, Abacus House
Barbourne, Worcester Tele-
phone 0905 612261 Contact:
Tony McDowell.

Claremont Controls Ltd Stand: B61

The effective management of projects is essential. Many projects are clearly recognized building a bridge, launching a satellite. Many other projects are less easily recognized installing production line, marketing a product, developing a new technique. Common to all projects is the need for effective management,

ensuring that the resources of an organisation are productively employed and smoothly coordinated.

Hornet is an aid to effective project management. It combines the very latest microcomputer technology with long-established management techniques to provide a tool which is at once both powerful and convenient. It ensures that realistic targets are set, expenditure is kept within budget and resource are efficiently used.

Hornet is a complete system which enhanced the effective management of any project.

Claremont Controls Ltd, Albert House, Rothbury, Morpeth, Northumberland. Telephone: 0663 21061. Contact: Roy Stephenson.

Compsoft Ltd Stand A11

Compsoft is showing the popular DMS (Data Management System): DMS is the powerful records management system which won the 1982 RITA Award for Software Product of the Year. This database can be used for any record keeping job such as client/customer records, invoicing, personnel, library, stock, medical or property records.

THE 4TH INTERNATIONAL COMMODORE COMPUTER SHOW

Although the user sets up unique files to suit the exact requirements of his/her company or organisation, DMS works entirely in English and requires absolutely no programming.

All versions, except those for the 3000 or 4000 series, have their own letter-writer and label printer as standard. This makes DMS a perfect system to use for selective mailing. The standard DMS on the 8000 series cost £290.00 and the DMS Diamond £395.00.

All Compsoft's products are supported by a Users Club giving hotline support, a quarterly newsletter and an update scheme, plus training courses at the Compsoft Training Centre near Guildford. Application Guides showing DMS dealing with a variety of different tasks are available free on the stand.

Compsoft Limited, Hallams Court, Shamley Green, Near Guildford, Surrey GU4 8QZ. Telephone 0483 888545. Contact: Jackie Chalcraft.

Computastore Limited Stand B1/3

Computastore will be showing a brand new version of Superpay for the 8000 Series. Pets with even more facilities and great ease of use than before — and still only £395.

Over the past 4 years Computastore's Superpay and Basic Pay Payroll packages have proved their effectiveness in over 1700 companies — ranging in size from 6 employees to over a thousand.

And now the new version of Superpay is even more flexible. Additional features include Statutory Sick Pay calculations, 11 Gross Pay elements — ideal for manufacturing companies with complicated payment methods. Multiple companies on a single disk — ideal for bureaux with lots of clients. Greater disk capacity — up to 900 employees on a single disk. New screen layouts — to make day to day operation even easier. Reset employee totals to last week — to re-run an incorrect payroll.

Runs on 8000 and 700 Series Commodore Business Computers.

Computastore Limited, 16 John Dalton Street, Manchester M2 6HG. Telephone 061-632 4761. Contact: David Nicholson.

Strengthen your hand *with* Superbase 64

The complete information control system for the Commodore 64. Ideal for any home, business or professional environment where records are kept. Create the format you

need and enter your records. If the layout or data field sizes are not quite right, correct them and carry on. Superbase gives you an unrivalled range of powerful features including

FLEXIBLE RECORDS

- Fully definable records with text, numeric, calculated result, date, constant, linking and key fields
- Record size up to 1000 characters
- Up to 128 items per record
- Up to 4 screens per record
- File size up to 16 million characters

QUICK ACCESS

- Search, select from and sort names, dates, values
- Fast key access
- Search and select using multiple criteria
- Print, display or store selections
- Fully definable report and screen formats
- Browse feature

EASY AMENDMENTS

- Add or remove fields dynamically or alter their length with no need to rebuild files
- Completely redefinable records
- Full file update and delete facility
- Fast on screen recalculation of numeric fields gives genuine spreadsheet capability
- Calendar arithmetic

LINKS TO WORD PROCESSING

- Links to Easy Script word processor and Easy Spell for misspelt letters, quotes, tables etc with 100% spelling accuracy
- Calculator and explanatory HELP screens
- Off the Shelf applications to suit your special needs - customer/client records, stock and catering etc

Come and see for yourself at the Commodore Computer Show, Cunard International Hotel, Hammersmith 9-11 June 1983 on Stands B36 and B124

THE 4TH INTERNATIONAL COMMODORE COMPUTER SHOW

Commodore Computing

Stand A20/B120

Commodore Computing International Magazine, now available nationally, is dedicated solely to users of Commodore machines. This is the magazine that is always first with information packed articles. Whatever it is you require — news, hardware/software reviews, programs for all types of industrial, business and home use — look in Commodore Computing International Magazine first. Visit us on stands A20 and B120, buy a copy, take out a subscription and be amazed at the range of literature available — Pet Graphics, Vic Revealed, Vic Graphics, Vic Games. Should you have any queries or programming problems then the staff of Commodore Computing International will be more than willing to help you.

Commodore Computing International, 167/169 Great Portland Street, London W1N 5FD Telephone 01-636 6354 Contact: P. Chandler.

Commodore (Concessionaires) Ireland Limited Stand B3

In Ireland one of the fastest growing sectors of the economy is the electronics area. The Industrial Development Authority has made it clear that it puts much of its hopes for industrial development in this area.

Already the successes have started with more and more of the highly advanced electronics industries setting up and others looking towards Ireland which has one of the youngest and most adaptable and best educated populations in Europe.

One of the major areas of growth has been in computers and software, and the Irish market has been growing by leaps and bounds as a new industrial base is built up.

At Stand B3 you are welcome to come along and hear the facts and figures on the Irish market from Commodore (Concessionaires) Ireland Limited drop in and see us.

Commodore (Concessionaires) Ireland Ltd, Barton House, Francis Street, Galway Ireland Telephone 010-353 916 7156 Contact: Rod McGowan.

The Computer Room Stand B39

The Computer Room is presenting two new Commodore approved products.

• **Epic (Engineers Production and Information Control):** EPIC is a manufacturing system designed for the small-sized manufacturing company in the job or batch production environment. It is available in modular form and its features include the following:

Method File, manufacturing process information for each product
Job Cards, factory paperwork and progress information
Shop Loading, scheduling of customer demands to man or machine resource
Factory Performance.

measurement of both operator and machine performance
Stock Control all levels of manufacturing including raw materials are catered for.
Customer Schedules: up to date status of customers orders
Management Information: production programs, order analysis and other key reports.
Database: file system for tooling or drawing records.

• **Moons Strip Supernews:** Based on the Commodore 64, Supernews is the most flexible and the most cost-effective system on the market for newsgroups. The complete system costs from around £1,500 and provides complete control of newspaper delivery and accounting, rounds lists, substitutions, holiday stops and starts, special stops on TV Times and Radio Times, statements,

morning and evening rounds, price changes handled in office, physically very small, debtors listings, 800 accounts per diskette and nationwide maintenance cover.

Supernews is the first approved product on the CBM 64 and is available nationally through selected Commodore dealers.

Henderson Bennett (^{Micro}Computers) Ltd.

40 SPRING LANE . WOODSIDE . LONDON . SE25 4SP
TELEPHONE 01-656 0656

A. Visitor Esq.,
Messrs Each & Everyone,
Commodore Computer Show,
London, W.1.

9-11 June 1983.

Dear Visitor,

If you can recall all you've seen today, alone in the quiet of your own office, then you don't need a computer. You already have one between your ears!

However, if you are a normal human considering the use of a computer in your business, you've taken the correct first step in coming to the Commodore Show.

No doubt you've been almost overwhelmed with the versatility of the hardware and amazed by the range of application software on show. How are you to make your final choice?

This is where we come in if your business is in the South London, East Surrey, West Kent or North Sussex areas.

We are a small independent company dedicated to the sale of Commodore Computers. The company was formed as a direct result of the Directors buying an original Commodore Pet 2008 four years ago for use in their Technical Sales Office. It transformed the business and paid for itself in six weeks as a result of improved sales throughput. We know the machines. We know the problems. We know we can help you. Just fill in the proforma below and we will contact you to get you started, or telephone * 656-0-656 *

Yours sincerely,

Malcolm J. Bennet

Commodore — Education Department Stand D4

Commodore has a special exhibit which underlines their commitment to the educational opportunities in computing. Prime attention is focused on the Commodore Educational 64 machine — a Pet housing with a colour monitor. Commodore 64 technical specifications, incorporating the LOGO language Expert educational software producers are featured including:

- Data Immersed of Cheltenham — with 'Talking Books'.
- Studio Software — with their 'designer' and 'micrometer' programs
- Birmingham University — with their special pre-school software.
- The Camsoft German Tutor.

There will also be a major Commodore Networking System on the stands showing the local area network that Commodore have devised, incorporating Prestel and Per-Net.

Commodore Educational Department, Ajax Avenue,
Slough, Berks. Telephone: Slough 74111. Contact: Nick Green.

Commodore New Products Stand D2

Certainly the highlight of this year's Show will be the many new computer hardware products on display for the first time in Britain.

The Commodore New Products stand will feature the Commodore 64 portable computer and the Commodore

700 series business computer with CP/M and MS-DOS. Each system will be available for hands-on experience for any visitor attending the Show. Also on display will be the new Commodore 1820 printer-plotter which interfaces to the Vic-20 or Commodore 64.

Of particular interest to businessmen should be the new systems printer — the 6400 — which will make its debut at this year's Show. The 6400 is a powerful, fast daisy-wheel printer that complements the 3000 series and is currently available with the friction feed option.

Other new products on the Commodore stand include the 1701 colour monitor for the Vic-20 or Commodore 64 and the new 8250 disk drive in a low profile housing.

Commodore will have a host of trained representatives on hand to answer questions and demonstrate how Commodore's latest products are of proven benefit in both business and the home.

Commodore Business Machines, 675 Ajax Avenue,
Trading Estate, Slough, Berks
SL1 4BG. Telephone: Slough 74111. Contact: Aileen Rindley.

Commodore Sales Training Stand B10

Did you know that Commodore offers a range of sales and management training courses exclusively for Dealers and Approved Products suppliers — and all at no charge? You will be able to see the complete schedule of the courses available and find out more about them on our stand.

Commodore Business Machines, 675 Ajax Avenue,
Trading Estate, Slough, Berks
SL1 4BG. Telephone: Slough 74111. Contact: Brian O'Hara.

Commodore Software Stand D3

On Stand D3 Commodore will be showing the latest range of software for the Vic-20 and Commodore 64 that is currently available in the UK.

The stand will have six equipment desks divided into three demonstration areas. On one side will be new business software such as Future

THE 4TH INTERNATIONAL COMMODORE COMPUTER SHOW

Finance, Easy Script/Easy Spell and Easy Stock in the centre area will be two desks: one will have a Commodore 700 series business computer with software, the other is devoted to thinking and decision games such as High Flyer (a remarkable disk-based game about airport management with true-to-life graphics) and a new adventure game called Medusa's Lair. Opposite the business software will be a rolling demonstration of Simon's Basic, FastSpeed, Assembler and many other useful utility programs that help to maximize the effectiveness of Commodore machines.

At every station, Commodore technical experts will be on hand to answer questions and demonstrate the features of each Commodore software product.

Commodore Business Machines, 675 Ajax Avenue,
Trading Estate, Slough, Berks
SL1 4BG. Telephone: Slough 74111. Contact: Marilyn Rutley.

DAMS Business Computers Ltd Stand B13

DAMS Business Computers will have on display its highly successful IEEE cartridge which plugs into the back of a Vic-20 or CBM 64 and will connect all peripherals previously associated with Commodore Pets. No software change is necessary and the cartridge comes with a full 12-month guarantee.

This cartridge is being widely exported and has had an enthusiastic reception from users abroad and in the UK.

Also for the Vic-20 and the CBM 64, DAMS RAM 'n' ROM board is an exciting add-on at only £22.95 plus VAT. On its own it has 3K of RAM, adds to this two empty ROM sockets for further expansion — or simply plug in with a DAMS VIGROM chip (the ultimate machine code monitor with 24 direct machine-code commands at your disposal) and/or the VICAD 'lookit' chip, which will enable you to debug that crashed program (plus eight other 'lookit' commands and a

further eight TIM machine-code monitor commands).

DAMS' anti-glare screens are available for all Commodore machines and are an effective way to reduce eyestrain at a low cost of £19.95 plus VAT.

DAMS Business Computers Ltd, Gores Road, Kirby Industrial Estate, Liverpool L33 7UA. Telephone: 051-548 7111. Contact: Ian Hetherington.

Datatronix AB Stand A13

This year on the Datatronix stand we will be showing:

- **Calc Result** — a three dimensional calculation program with built-in graphics, help functions, flexible printout facilities, colours (64), communication (700). The most powerful, flexible and easy-to-use calculation program for Commodore 8000 and Commodore 64.

- **Vic Switch** — a multitracer unit for Vics and 64s. Vic switch enables you to connect up to eight Vics or 64s to the same disk drive and the same printer. Vics and 64s can be connected at the same time.

- **Pet Switch** — a multi-user system for the Commodore 8000 computers.

- **Backup-system** — for the Commodore hard disk. The Hardic backup system enables you to make backup from the hard disk directly to a video recorder.

- **Diary** — a database program for the manager. You can, for example, store phone numbers, addresses, appointments etc. Diary is a cartridge-based program for the Commodore 64.

- **Exciting adventure games** for the Commodore 64 — Ship, Mutant Spiders, The Fourth Sarcophagus.

- **Several cartridge-based programs** for the Vic-20 and the Commodore 64 such as Forth, Star and Graph.

Handic Software AB is a company in the Datatronix Group and its software products are available wherever Commodore Computers are — throughout the world.

THE 4TH INTERNATIONAL CONVENTION

Cunard International Hotel, Hamme

Lammersmith, London, 9-11 June 1983.

Dataview Group Stand: D1

Based in East Anglia, the Dataview group consists of four companies all involved in the marketing of modern office technology products and services

• **Dataview Limited:** One of the leading publishers of microcomputer software, earning significant export revenues for the United Kingdom. Specialising in the area of professional business software, Dataview products have been brought by well over 30,000 business system users in Britain alone. Dataview just won an ICP Five Million Dollar Award for Wordcraft sales.

The company also sells business microcomputer systems throughout East Anglia and with a customer base of 1,000 installations is known for its commitment to the microcomputer user. Full engineering and programming services are provided by Dataview's own staff.

• **Dataview Systems Limited:** Specialises in supplying larger applications requiring a 'systems' approach.

Consultancy services can be provided and the company has much experience in planning, design and the implementation of large integrated computing systems.

Dataview Systems also specialises in the writing of computer programs for customers who cannot resolve their business needs using 'standard' packages. This 'bespoke' approach has been successfully applied to a number of business areas and DSL systems have written programs for many computers including IBM System 23, AROS, Honeywell, DEC and Data General equipment.

• **Dataview Inc:** Based in Philadelphia, spearheading the export drive to market Dataview's products in the United States.

• **Dataview Supplyline Ltd:** The range of products includes electronic typewriters, word processing systems, facsimile transmitters and OCR readers.

To provide you with a first-class service, it is our policy to sell through an extensive dealer network. Our dealers are strategically located all over the UK so that you can contact them by personal visit or by

phone: in fact we have over 300 approved dealers in this country, all of whom can provide you with information about Dataview's software packages.

• **Wordcraft:** Turns a microcomputer into a very accomplished word processing system.

• **The Executive:** Combines the power of Wordcraft with information retrieval.

• **The Financial Director:** A powerful program that provides the businessman with the ability to conduct financial analysis and strategic planning.

• **DATA-LEX:** An accounting and time recording system for solicitors to handle client and office accounts to guidelines laid down by the Law Society.

• **Electronic Cash Book:** Allows one of the most irksome tasks of a business, maintaining and reconciling the cash book, to be carried out easily and conveniently on a microcomputer.

• **STOCK-AID:** A full stock control and stock management information system to maximise the probability of a business.

• **DTL BASIC COMPILER:** Suitable for users who enjoy writing programs using Basic. By using this program it is possible to translate or convert the program to 'pseudo machine code'.

• **DLT BASIC System 85:** For the CBM 8096 computer. Using this system it is possible to develop Basic programs almost 250 per cent larger than has previously been possible.

• **HYDRA:** Local Area Network system for the CBM range of computers.

Dataview Group, Portvee House, East Bay, Colchester CO1 2XB Telephone 0206-859414/865835 Contact: Paul Handover/Amot Roy.

DDM Direct Data Marketing Ltd Stand B69/B70

Not content with presenting the most comprehensive yet user-friendly software pack for the production manager operating on the 8000 Series, DDM are already optimising **Factory Manager** for the new 7000 Series With Factory Manager, you can

PRODUCTION (a) obtain an immediate screen display of progress on a particular customer's job. (b) print a list of progress on all jobs as they move from process to process through the factory. (c) print a report of every operative's per-

formance each day to show whether the quality of work and the work rate are at required levels.

STOCK (a) obtain an immediate screen display of the status of a particular stock line, current level, unit cost, supplier, quantity on order, projected delivery date. (b) print a stock valuation list either for all or for a section of stock lines. (c) print a list of all items whose stock levels have fallen below a predetermined minimum.

ASSEMBLIES (a) given an instant printout of all parts necessary to produce a given number of a finished product. (b) print out a list of all components whose sufficient stocks exist for a projected production run.

SYSTEM CAPACITIES Up to 4,000 lines of stock. Up to 100 jobs and assemblies.

Up to 40 different components in any one assembly.

Up to 9 production areas and 150 different processes. Now with the launch of the CBM 54, DDM can offer a cost effective, disk based system for stock control with detailed Manufacturer's Reports at a total hardware and software cost of well under £1,000.

DDM Direct Data Marketing Ltd, 86/87 Wilton Road, London SW1. Also at 22 Warley Hill, Brentwood, Essex. Telephone: 01 834 5016/0277 214158 Contact: Louis Szekera.

3D Digital Design and Development Stand B77/78

Two new products launched at the Commodore Show will make welcome additions to the extensive range available from 3D Digital Design and Development - the first: interface specialist to offer a complete range of IEEE 488, RS-232C, memory mapped and remote intelligent scientific and industrial interfaces for the entire Commodore range.

3D's existing versatile IEEE-compatible Basic-addressable standard units and its multi-channel modular INLAB system have already proved popular with an impressive list of Commodore users which includes ICL, Ford, British Gas, Plessey, Marconi, and British Telecom.

The range of applications is virtually limitless - industrial

Dynatech Microsoft Ltd Stand A29/A30

Dynatech Software will have on exhibition their very fine soft ware package **CODEWRITER**.

"Design your own business information programs in plain language — **WITHOUT PROGRAMMING**. Simply type the screen layouts the way you want them and add calculations you need — and **CODEWRITER** takes over. Your Commodore 64 becomes your private programmer. You get your programs for information entry, searches, updates, automatic calculations, etc. Programs to write reports print cheques, letters, mailing labels, nearly anything — all written for you by **CODEWRITER**. You can even use **CODEWRITER** to design your own menus.

Full retail price £125.00 plus VAT.

Dynatech Microsoft Ltd, Sunnyside House, Vale, Gwent, Channel Islands. Telephone: 0481 45934. Contact: **John Margerbanks**.

FACTS Software Ltd Stand B46/47

The Microfacts range of accounting packages will be shown on the Commodore 8000 Series and the new 700 Series.

This long-established, high quality suite of programs has long been a best seller for Commodore. There are now some 700 installations of the package in the UK and abroad and the system has been sold by the Commodore dealer network for around three years.

Particular features of interest

THE 4TH INTERNATIONAL COMMODORE COMPUTER SHOW

are the ability to maintain accounts for a number of companies, each with several Sales and Purchases ledgers on the same pair of floppy disks. This obviously makes the system extremely easy to use.

Designed and implemented by people with many years practical experience, not only of implementing mechanised accounting systems, but also of running a typical small to medium sized business, particular emphasis is put on the practical aspects of the system and its overall ease of use.

A unique feature of Microfacts is the ability to maintain job cost records totally integrated with the accounts data. This is particularly important for any prospective customer working in a contract environment — e.g. builders, plant hire contractors, office cleaning contractors.

Prices range from £300 to £1800 depending on requirements.

FACTS Software Ltd, 75-79 Tavistock Street, Bedford MK40 2RR. Telephone 0234 218191. Contact: **Shane Barnes**.

FCG Computer Systems Stand B74/B75

FCG will be exhibiting their established contractors' payroll and accounting systems along with the soon-to-be launched bill of quantities/estimating systems. The contractors' payroll and accounting systems are now in use in over 150 contractors' offices throughout the UK. They take account of all the specific requirements for contractors, for example holiday

with pay stamps, rates allowances and travel money, C714 sub-contractors and both systems give complete contract costing. The bill of quantities/estimating systems can be used for bill production and monthly valuations by quantity surveyors and the estimating module will enable contractors to produce estimates.

FCG Computer Systems 3 Hamilton House, Mabelton Place London WC1H 9BD. Telephone 01 388 7345. Contact: **Nick Hayes**.

Holdene Trade Ltd Stand B6

Holdene Trade Ltd specialises in supplying printers, plotters and VDUs with associated software, to retail outlets. Holdene has recently been appointed sole UK agents for the Grand Bryan range of digital plotters. The Epson range of printers include the New FX80 160 CPS unit with optional serial or parallel interface. Other equipment on show includes the low-cost HP7470 plotter, the British-made Insight terminal range and the Newbury Data Printers.

Holdene Trade Ltd, Bray House, Leicester Place, Leeds. Telephone: (0532) 453459. Contact: **Margaret Smith**.

IMI Computing Ltd Stand B80

• **The Catering Manager**: A stock control and recipe costing system for industrial caterers and canteen establishments.

• **Microspec**: A cost estimating, specification and tendering package for architects, surveyors and building contractors.

CBM-64 PET & VIC-20 SOFTWARE

SYNTHY-64

£14.95

Music and sound synthesiser for the CBM-64 has the most sophisticated sound capabilities of any personal computer. However these facilities are difficult to use from BASIC, requiring a series of POKE commands. SYNTHY 64 makes it easy to create music using simple commands. The package includes a detailed manual and sample compositions.

PIPER

£9.95

The music capabilities of VIC are rather less sophisticated than those of the CBM 64, but PIPER provides many of the facilities of SYNTHY 64 to make music composition simple on the unexpanded VIC. A version of PIPER is also available for the PET.

SCREEN GRAPHICS-64

£14.95

Adds more than 20 powerful commands to Basic to plot points, draw lines, circles and boxes, use sprites and even display text with graphics. SCREEN GRAPHICS-64 gives you High Resolution, Multicolour and Sprite graphics all in one package. Two screens are provided: one for normal text and one for graphics and you can switch between the two using the function keys or under programme control.

GRAPHVICS

£12.95

Provides many of the features of SCREEN GRAPHICS 64 for the VIC with 3K or 8K + expansion.

SPRITE AID

£9.95

Define SPRITES on your CBM 64's screen using the keyboard or joystick. Save the sprites as data statements for use in your own program using the 'sprite aid access routine'. A demonstration program and manual are included.

Software is provided on cassette or on disk for £1.50 extra. Deduct 10% when ordering two or more packages. All prices are fully inclusive. Add £1.00 per item for overseas airmail. Dealer enquiries invited.

Send SAE for catalogue of games, language and utility software for all CBM computers.

ADAMSOFT,

18 Norwich Avenue, Rochdale Lancs OL11 5JZ.

BILLS OF QUANTITIES PRODUCTION

on a low-cost micro-computer — with automatic sort, comprehensive library, short codes and cost analysis!

Suites of programs for the Professional Quantity Surveyor which produces Bills of Quantities and Abstracts in varying formats, tender cost analysis in BCIS elements and Cost Breakdown in NEDO categories for post contract and interim valuation purposes.

Masterbill supply a complete package specially designed by Quantity Surveyors for Quantity Surveyors which is suitable for all organisations — from the small to medium office branch office or group within a larger organisation.

MASTERBILL BILLS OF QUANTITIES SYSTEM

To complete the system we can supply and give you free on programming for Word Processing, Data Management, NEDO Publications, etc. Costing: plus the many standard Commodore programs related to the Construction Industry.

Imperial Chemical Industries PLC Stand B52/C51

• **Rexagan**: a system which links microcomputers to laboratory and process instruments for data acquisition and process control. It was designed to meet the widely varying needs of ICI scientists and engineers, and is used throughout ICI.

Rexagan forms a versatile, integrated and cost effective system which can be used by junior technicians or senior engineers alike. It can do several jobs at once — collect data, send control signals, monitor processes, activate equipment etc. Rexagan comes complete with application and programming instructions in a well written, well illustrated manual. Valuable software is also provided with each unit. Rexagan is available for all Commodore computers.

• **Super Rexagan**: expandable without practical limit to solve large-scale process control problems. Housed in a rugged, but stylish industrial enclosure, it can be supplied for 19 inch rack mounting. Super-Rexagan is available for Pet 3000, 4000 and 8000.

• **Junior Rexagan**: an ideal low-cost tutorial interface for microcomputers in schools and colleges. It may be used to teach microcomputer interfacing at all academic levels. Alternatively, Junior Rexagan functions as a tool for data acquisition and control of simple experiments in the teaching laboratory. A comprehensive user guide shows how to install Junior Rexagan, provides detailed software and describes experiments to demonstrate its use.

Junior 'Rexagan' is available for PET 3000, 4000 and 8000.

• **Tomult**: a powerful multitasking executive — a software system to greatly simplify and speed up the writing of complex programs. It is intended in particular for applications in which the microcomputer is used to monitor and control events in

Jentech Services Ltd Stand B76

Jentech Services is exhibiting an exciting new development of its **DIGITMASTER** package — the **Commodore 2D** computer-aided draughting system. The package will have a second screen option to allow visual display in colour of individual elements and complete drawings similar to typical two-screen systems of much higher cost.

The system allows creation and manipulation of drawing elements which can then be merged to produce a composite drawing very rapidly through a number of flexible routines. This speeds up drawing production. Elements and drawings may be

scaled, rotated, mirror-imaged, moved, magnified, reduced, added to or deleted from. Information entry is extremely direct and easy — either in terms of numerical values from the keyboard, or directly by using plotter or Bit Pad entry. Information may be entered directly or relative to the current position or preselected datum points.

The system incorporates powerful lettering and automatic dimensioning which enormously speed up the laborious and time consuming aspects of producing drawings.

The system is menu-driven and full instructions are on screen at all times. This means that operator acceptance is very high. It can be easily tailored for specific applications, especially whereby a small component part can be defined by a few key dimensions.

The system is suitable for small engineering companies who cannot afford conventional CAD or for autonomous departments within larger companies.

Kobra Micro Marketing Stand C56/B57/B58/C59

Kobra Micro Marketing is one of the UK's leading distributors of business and systems software for the Commodore 8000 and 64 computers. Well known brand-name products on show on the Kobra stand are Calcresult — the only 3D spreadsheet for Commodore computers, Paperclip — the powerful but low cost word-processor, Mupet I and II — the leading multi-user system for Commodore systems POWER and PAL — professional programming aids, Vic and 64 Switch for low-cost multi-user systems. Other products include Forth, STAT and Diary, for the 64.

Landsoft Stand A71

Landsoft, a company respected for their quality software for the Commodore micros, will be showing their latest payroll and

word processing — Payroll 2 and Wordform 700.

Payroll 2 is designed to ease the processing of payroll and statutory sick pay. The program is extremely fast and the simplicity of operation gives new meaning to the networked term 'User Friendly'. It also handles SSP in what is believed to be the most helpful manner the program can produce a very full analyst and a very useful 'wages book'. It will produce end of year P14 (SPIs), P60 and P35 forms. It can also print Giro and cheques together with their respected schedules. The program copes with payrolls with, from a couple of employees up to 250 per disk. In fact, Payroll II has no limits as the analyses can be combined from separate disks. The program is in use, not only by companies but, by many accountants and even Bureau.

Wordform 700 is a truly remarkable word processing program at a remarkably price. It should not be compared just with other Commodore Word Processors but with ALL processors even the dedicated one, by the very nature of its manner of operation it should become the one by which all others are judged — a bold claim but one we feel is justified. Wordform 700 will be available from August.

Mills Associates Ltd Stand B60

Mills Associates is the only
independent maintenance
company recommended by
Commodore to provide com-
prehensive engineering

services on a national basis. We
have been active in computer
servicing for 20 years and have
established a network of 10
regional centres.

- **Full Maintenance Contract:**
This is designed for users for
whom a minimum of down-time
is essential. The service
includes two routine
maintenance visits each year
and a call-out service with
24-hour response and fix times.
Replacement loan units for
atstand equipment are
available at no extra cost and
the annual contract charge
includes all replacement parts,
labour, travelling, etc

- **Fault Repair Contract:** If
same-day response is not
essential then Mills' low cost
fault repair service is the
answer. This provides for call-
outs on a 72-hour response, and
as with the full maintenance
contract, all costs are included
in the annual charge. Similarly,
replacement loan equipment is
available at no extra cost.

- **Workshop Services:** We
provide a comprehensive
range of workshop services for
Commodore computing
equipment. This includes fixed-
price board and unit repairs,
cable assembly, PROM
programming, unit upgrades
and an exchange unit service.
We are also able to provide a
collection/delivery service
using our own transportation or
a carrier firm.

Oxford Computer Systems Stand B106/107

Oxford Computer Systems'
stand will be dedicated to the
phenomenal INTERPOD - a
product unmatched for
capabilities and versatility
throughout the world.

INTERPOD is an ingenious
multiple interface that enables
the Commodore 64 to make use
of the wide range of printers
and disk units currently on the
market. An intelligent multiple
interface which plugs directly
into the serial port of the 64
INTERPOD features both RS232
and IEEE interfaces, enabling
both ports to be used by the
Commodore 64 without any
further operation.

Unlike other interface
systems, INTERPOD offers, as
standard, both RS232 and IEEE
interfacing. Additionally,

Jondane Associates Ltd.

Precision Software Ltd Stand C35/C38/B36/B37

Precision Software Ltd., a leading UK software house, launches today a new suite of software products designed specifically for Commodore computers.

SUPERBASE: Running on the Commodore 700, SUPERBASE sets new standards in file management systems for flexibility and ease of use with large record sizes fully redefinable multi-screen record formats, spreadsheet-like calculation facilities, fast key access with selective retrieval, transaction linking sorting and fully definable record formats. SUPERBASE can also be linked to SUPERSCRIPT II.

SUPERBASE 64 is running live on the Commodore 64 on Stand B124.

SUPERSCRIPT II: An enhanced version of the popular fully featured word processor. Versatile, fast, simple to learn and use, SUPERSCRIPT II processes letters, quotations, reports, memos and standard forms with professional ease, enhancing presentation and ensuring perfect copies every time.

Unrivalled table handling with 240-column wide screen, scrolling in all directions, arithmetic, memory calculator, column manipulation and mail merge with record selection,

2,100 lines of 80-column text. And it spells!

SUPEROFFICE: The ultimate integrated office administration system with full records management, calculation, word processing and spelling checker. SUPEROFFICE combines the database handling of SUPERBASE with the document editing and formatting power of SUPERSCRIPT II. Available later in the year at £850.

Precision Software specialises in software development and markets through dealers in Europe and North America.

Paradox Group Limited Vie Computing and Commodore User Stand B119

You are holding the latest publication from the Paradox Group. This issue of **Commodore User** is a pilot for a full-scale nationwide newsstand launch in the Autumn. The new magazine will be the first and only magazine to address the full

range of potential readers who are interested in Commodore's computers (by choice or by necessity).

For the meantime you'll know our style and our approach from **Vic Computing**, the bimonthly magazine dedicated to Commodore's small computers; and our **Vicwear** operation, selling high-quality tee-shirts and sweatshirts with witty and/or classy Vic-related slogans.

The readership of **Vic Computing** is international, and the magazine's content is almost as wide - from explanatory articles for beginners to our regular query-answering **Tommy's Tips** page, from readers' programs to the masterful insights of columnist Jim Bunkerfield, from the staid gaze of our **Eye** on Commodore to the regular reviews are run of hardware, programs, books and anything else related to the Vic.

The current issue of **Vic Computing** will be on our stand, along with back issues (single copies £1.00, annual subscription for the UK £5.00). Our stand's **Vics** and **64s** will be running some of the games and other programs featured in **Vic Computing**.

Paradox Group Limited - Vic

Quick-Count Ltd Stand A18

We shall be demonstrating our Time Recording System for Accountants with Sales Ledger on the CBM 8000 series in association with our UK distributors.

Micro Computation. This has now been in the field for two years, and users comment that "it does the basic best". **Micro Computation** will also be demonstrating preparation of accounts from Incomplete Records. Regional dealers who specialise in the accountants market are specially welcome.

We shall also be releasing a new Cash Traders Book-keeping System on the CBM 64, which will be priced at £89.00 + VAT and the exciting new computer teaching book for under 10s. Mr Chippy by Avril Newman.

Quick-Count Ltd, 15 Neeld
Crescent, London NW4

Telephone 01-202 5486.
Contact: Arnold Shaw.

Rabbit Software Stand A128/129

You won't need to look a lort for the Rabbit stand at this Show. Just head straight for the area with the greatest density of bodies - because we can guarantee that all those Vic-20 and 64 owners will be anxious to buy our latest games, and our special offers will add additional incentive.

For the 64 we have **PACKACUDA**; you control a barracuda swimming around eating as many fish as possible whilst fighting off the antics of the ravenous octopus. Then there's **ESCAPE N.C.P.**; you are trapped in the deeper levels of your Commodore 64 memory banks and must work your way up through the N.C.P. to the 10 ports without being de-Res'd by one of the 6503 droods.

But those are just two of the six latest games we have for the Commodore 64 at this show. There will also be **CENTROPIDS**, **GYCONES**, **ANNIHILATOR** and **MONO-POLEE**.

Then there are the Vic games. There will be nine new block busing games for the 20 at the show, all better than anything ever loaded into the Vic before.

There's **PARATROOPERS**, **ANTI MATTER SPLATTER**, **THE CATCHE**, **ENGLISH INVADERS**, **PACKACUDA**, **ESCAPE N.C.P.**, **CRITTERS**, **GYCONES** and **RACE FUN**.

But to get onto a more serious note we also have a constant rolling demo of our amazing business program **INTOMAST** for the Commodore 64.

So don't forget to make the Rabbit stand your first port of call at the show.

Rabbit Software, 380 Stetson
Road, Harrow Middx.
Telephone 01-863 0833.
Contact: Terry Grant.

SPT Electronics Stand B115/116

QUICK BROWN FOX, the word processing software package from SPT Electronics for the Commodore Vic-20 and 64 computers costs only £80 and has many advanced features - including full line and global edit capabilities, text moving, merging, tab and margin settings, right justification and proportional

THE 4TH INTERNATIONAL COMMODORE COMPUTER SHOW

expecting QBF also automatically re-formats edited text, not the tedious paragraph-by-paragraph employed by other programmes. All QBF commands are logical, requiring single key operation; some competing programs require complicated two-finger 'acrobaties' to implement a command.

The QBF software is based on a new design concept that supports a wide variety of printers. QBF is so cunning that an inbuilt program converts the Vic-20 to run on a Centronics parallel interface, allowing you to choose peripheral equipment without the need for adaptors.

Quick Brown Fox works on the Vic-20 5K memory thus freeing more memory for actual word processing. Unique amongst word processing software, QBF can send and receive information from one computer to another via built-in telecommunications facilities (this can be accomplished either by telephone modem or by direct contact via the RS-232 port).

The Quick Brown Fox fully featured word processor system costs less than £1,000. This remarkable wordprocessor breakthrough is achieved by SPT Electronics, combining the QBF software program with the Commodore Vic-20 or 64 computers, additional memory 80-column display monitor and a daisy-wheel typewriter/printer. The high versatility of this system would normally only be found in systems costing at least £2,500.

SPT Electronics, Tollisbury, Melton, Essex. Telephone 0631 864844. Contact: S. McCrudden.

Stack Computer Services Ltd Stand A130/A131

Following the success of Stack's accessories for the Vic-20, the Liverpool based company have launched new ranges of products for the Commodore 64, Atan and BBC (model B) range.

Products include utility cartridges, joysticks, lightpens

and software multi-cartridge boards, serial and parallel interfaces and cables, dust covers — and more are on the way.

Stack also has new products for the Vic-20, including and IEE cartridge.

Stack's chairman, Jell Orr says "we are satisfying a demand in the home computer market that has grown up in the last year or so. While some people have been busy producing software we've gone for hardware/firmware side of things."

"Stack's products have been extremely successful in the UK and we now export to more than 20 countries around the world."

"Our policy is to remain flexible and follow the big-selling micros with our products for the benefit of ourselves the dealer and the customer."

Stack Computer Services Ltd,
290/298 Derby Road, Bootle,
Liverpool, L20 8LN Telephone:
051 533-5311

Stage One Computers Ltd Stand A21/22

● **The Administrator:** The Administrator is the first choice for processing records which require unlimited information to be stored for either text or accounting or mathematical or history purposes.

Very user-oriented and helpful facilities enable to allow the set up of screen formats for records and menus so that they represent as closely as possible the user's manual system. The user menu facilities allow the completed system to operate like a tailor-made program.

A new and very powerful facility that is built in is the package's ability to 'learn' a job or sequence for subsequent automatic processing. For example, all month-end reports may be automated and run from a user-defined 'Month End Reports Menu'.

The package provides many unique features not available in other systems: it allows your task to be completed the way you want, and it makes set-up

and running simple for the novice user.

Other facilities of the package include searching, sorting, reporting, batch processing, integration with word processing, transaction sorting, analysis and statistics, index viewing or printing, change order of viewing fields on screen, selective reporting, new file creation, record format amendment, full labelling and mailing facilities.

We can honestly say no other package on microcomputers provides such a large number of useful facilities which are presented in so simple a manner for use by unskilled operators. The manual is exceptional and features an easy-to-read training guide with terminology explained and tips, do's & don'ts and suggestions highly lighted.

There are versions of the Commodore 8032 and 8096 priced at £495 and £395 respectively, and there is also a hard disk version.

A demonstration is highly recommended. So come and see us on stand 21 and 22 at the show — we will be pleased to answer any questions you may have.

Stage One Computers Ltd, 300
Ashley Road, Parkstone, Poole,
Dorset Telephone: 0202
733656. Contact: Kate Lusher.

Supersoft Stand B4/112

SUPERSOFT has been writing software for Commodore computers since 1978 and is now established as one of the leading sources of Pet software and accessories in the world. The SUPERSOFT aim is to offer the best available programs and accessories for all machines that Commodore produce, from the Vic-20 and CBM 64 to the 700 series and beyond.

This year software for the 64 features prominently on the SUPERSOFT stands with programs like BUSICALC and BUSIWRITER for the business user, and a range of games including CRAZY KONG, KARTUS, TANK ATAK, MANGROVE and STIX for the arcade addicts. Hobbyists will find a range of programming aids and utilities to make life easier — such as VICTREE which adds Basic 4 style disk commands and toolkits; functions; and I541 BACKUP, which enables disk users to make security copies on a

single drive is a must for all serious users.

More than 1,000 owners of 3000, 4000 and 8000 series machines have installed SUPERSOFT's low cost high resolution graphics boards. Now GRAPHIX software is available for the 64, making it easy to plot points, draw lines, and display text on the high resolution screen of the 64.

Calling all programmers! If you think that your programs are good enough to get into the SUPERSOFT catalogue you should contact us immediately.

STOP PRESS: on display at the Show for the very first time will be BUSICALC 2, faster and more powerful than BUSICALC, but still very competitively priced.

use, no training centres required, ideal for the general office or small business.

But beneath that meek and mild-mannered exterior are some powerful advanced features. You can 'pause' in the middle of any function, use the calculator or electronic jotters or many other unique facilities, and then continue instantly with whatever you were doing.

SUPERCLERK includes a special Business Basic programming language, and more experienced users can alter SUPERCLERK or add new functions. In technical terms SUPERCLERK provides fully integrated wordprocessor, database, sales/purchase/nominal ledgers/ payroll/and many utility functions. Prices from £395.

Superclerk 123A Market Street, Chorley, Lancashire England PR7 2SG Telephone 02572-78376 Contact: Chris Hicks.

Tamsys Ltd Stand B34

TAMSYS is one of the leading software distribution companies in the UK, representing most of the major producers of software for Z80 and 8085, 8086, 8088 based machines. As main distributors for both Digital Research and Microsoft, they will be exhibiting a wide range of these companies products on Commodore equipment. Also on show will be other leading CP/M and MS-DOS based products including dBASE II, Wordstar/ MailMerge and SuperCalc. TAMSYS will also be featuring the CP/Maker, a CP/M board for 4000 and 8000 series machines which not only converts these machines to CP/M but also increases their capacity in Pet mode to 96K.

The TAMSYS consultants on the stand will be pleased to

provide technical help and assistance relating to CP/M and MS-DOS as well as providing up to the minute details of the TAMSYS education and training programmes.

Tamsys Ltd, Pilgrim House 2/6 Wilham Street, Windsor Berkshire SL4 1BA Telephone: Windsor 56747 Contact: Patricia Oldcorn.

Taylor Wilson Systems Limited Stand A68

Taylor Wilson has developed lent highly innovative and sophisticated packages based on the Commodore micro-computer which can be seen at the show.

• **AUTOPLAN:** A powerful, comprehensive two-dimensional computer-aided draughting system.

AUTOPLAN can quickly generate high quality, full detail architectural or production drawings. The package comprises a Commodore 8032 micro, a Commodore twin-disc floppy disk system as an 'electronic plan chest', to store drawings or to hold programs which are a repetition choice of in-house plotter/digraphers. The plotter is used both for inputting and producing drawings.

Full editing of shapes and text is available with the system.

• **TOOLPATH:** created to verify CNC lathe programs by simulating the action of the machine-tool controller - TOOLPATH was originally produced for the training of NC programmers. It gives a high resolution accurate display of tool movement and metal shaping, and is widely used in training establishments in the

UK, Europe and Australia.

• **TAPEPREP:** a highly flexible and versatile package for the preparation, editing and punching of NC machine tool program tapes.

• **MILLPATH:** MILLPATH gives a near 3D simulation of how a machining centre will execute a CNC part program, drawing at high speed on an XY plotter to any pre-set scale and using different coloured pens to show the varying depth of cut. Utilising MILLPATH it is possible to check for errors on a part program away from the shop floor removing the risk of potential damage to the machine tool or its tooling. Because of this it is ideally suitable for training.

Taylor Wilson Systems Ltd, Station Road, Derridge, Solihull, West Midlands B93 8HQ Telephone 056 45 6192 Contact: J. G. Wynn

Technical Software Centre Stand A14

• **PLAN-KIT** Whatever the project, item organising a conference to equipping a factory or building and commissioning a power station, PLAN-KIT helps you to control and co-ordinate every activity and its timing.

PLAN KIT is easy to use. You don't have to be a computer expert, and you can key in up-to-date information at any stage to obtain a new analysis of your project's progress.

PLAN KIT can handle over 500 activities produces one of the most advanced and easily read bar-charts available on computer. It uses the precedence system (no dummy's needed) offers the choice of running with calendar

antler OF PALL MALL

HARD CARRYING CASE FOR VICED 64 — this is the answer to making your computer easily and safely PORTABLE.

This is a High Technology case from ANTLER with all the plus features:

- capacity for 2 tapes (2 different sizes).
- firm housing and maximum protection for computer and tape machine.
- compartment for leads, plugs, transformer and modulator.
- the computer can be used in the case if required with access to all connections and controls.

The case specification includes:

- tongue and grooved frame closure in hardened aluminium for strength and protection from dust and moisture.
- rigid moulded shells in durable black grained ABS.
- a cushion grip handle for carrying comfort.
- soft rubber non scratch studs are let into the panels to provide a swift free on/off slip location.
- the interior has an attractive hard wearing blue brush nylon surface to provide a quality finish.

PRICE £39.95 + £2.50 carriage

MASTER

MASTER is a totally new concept... a complete package for program development. Used by top professionals in the USA and Europe, MASTER has everything you need to write your own software, to the highest professional standards... up to 85 new commands that work with CBM Basic IV... and just one command can replace whole paragraphs of Basic code. That's why Master is...

a new concept in CBM Basic

MASTER has 17 DISK HANDLING commands (both keyed and sequential access, masked retrieval, batch operation, existence tests, etc)... 12 INPUT MANAGEMENT commands (input/output screen zones, with alpha, numeric and date formatting, etc)... 8 SCREEN MANAGEMENT commands (with screen pages loadable from disk or memory)... 10 commands for REPORT MANAGEMENT (with disk-loadable report formats)... 18 BUSINESS BASIC commands (with 20-place arithmetic, data compression, automatic date control etc)... and on the CBM 8096, all the features of PM96 (46K for programs, 26K for variables, as well as 17 BASIC UTILITY commands).

now available for the CBM 64

... including the full CBM Basic IV command set, and all the MASTER features listed above! Supplied on a CBM 1541 diskette, with a cassette port security key, MASTER 64 is the most powerful software utility ever offered to personal computer users! MASTER also supports CBM/PET models 4032, 8032, 8096, (and 8032 with CP/MAKER), as well as the CBM 4040, 8050 and 8250 floppy disks, plus the CBM 9060 or 9090 hard disks, and is supplied with a User Reference Manual, Quick Reference Guide, Installation Guide, Demo Disk, and with a security key for either cassette port.

PM 96 for the CBM 8096

CBM 8096 users can at last make full use of their 64K Expansion Memory... with PM96, the only product that offers sophisticated, yet simple, dynamic memory management... as well as 17 extra commands that work with CBM Basic IV. 82K of memory is available to the user, with 56K for programs (up to 16 together!), and 26K for variables (maintained even while editing or loading!). The new Basic commands include all the TOOLKIT functions, plus PRINT USING, IF-THEN-ELSE, STOP key disable, HARDCOPY screen dump, CALL, FETD, PLOT (50 by 150), WINDOW, and more. PM96 comes with a User Reference Manual, Quick Reference Guide, Disk with demo programs, and UDIL Support Rom.

Superscript

Now available for CBM 700 series

A Commodore enthusiast wanted a word processor that was simple, fast and easy to use. He wanted to handle up to 20,000 characters of text, use a wide screen format of up to 240 characters, with full window scrolling in all directions, and be able to use the screen while printing. He wanted a word processor at a reasonable price. The enthusiast, Simon Tanner, couldn't find one... so he wrote

Superscript

Superscript does everything he wanted... and much more. It provides a complete document preparation and storage system, making optimum use of memory and disk space. In short, it provides all of the advantages of a dedicated professional word processor. And now it's available for the new CBM 700 series computer, with arithmetic, calculator and a host of new features. And finally, the magic ingredient ...

Superspell

a 30,000 word disk-dictionary with automatic spelling checker, that will verify the largest Superscript (or Wordpro) document in under two minutes... and you can easily modify the dictionary, or add your own words.

Vizawrite 64

Designed especially for the CBM 64, vizawrite 64 is a high-performance, low-cost word processor, with on-screen formatting. Vizawrite takes full advantage of the 64's colour, graphics and memory features, and supports virtually any printer. It can even read text from Wordpro, Wordcraft or Sillicon Office files... Together with VizaSpell 64, a high-performance disk-dictionary and spelling checker, vizawrite offers the ultimate in personal computer word processing.

Tirth Ltd Stand B63

On Display will be the Crompton Personal Computer Desk, the Crompton Workstation and the Crompton Printer Stand. The Personal Computer Desk has been ergonomically designed to take any combination of Commodore hardware, but especially the CBM 500 and 700 series. The Computer Desk has a black leathercloth top and black metal frame, is mounted on castors and has a concealed cable tray which runs along the back of the desk. A fourgang 13 amp socket is mounted under the desktop which allows the papers to come through the slot or round the back of the desk into the printer. A paper catcher is available for the print-out. There are seven standard models with various combinations of top extensions and disk drive shelves

The Crompton Printer Stand is designed to accommodate the complete range of printers. The stand incorporates a paper feed slot which can be led by the paper tray beneath, there is a paper catcher at the back for the printout

Tirth Limited, Pear Tree House Woughton on the Green, Milton Keynes
Telephone 0908 679528
Contact: Mr G.W. Wright.

Vic Soft Stand D6

Vic Soft will be displaying Commodore's successful range of arcade games and software programs for the Vic-20 colour computer. In one area, visitors will have the opportunity to play several different arcade games or try out new ones which have not been released

Seventeen new ROM-based games will make their debut at this year's Show and VIC Soft will have all of them available for demonstration. Visitors will also have the chance to choose from the extensive VIC Soft catalogue and purchase their favourite games or software programs for the Vic 20 or the Commodore 64.

Vic Soft, Commodore Business Machines, 675 Ajax Avenue, Trading Estate, Slough
Berkshire SL1 4BG Telephone
Slough 74111 Contact: George Furnage.

VIC-20 and Commodore 64 Stand D6

Part of the Vic 20 feature area, stand D6 will have a number of Vic 20 and Commodore 64 set aside to show the user exactly what each type of computer is capable of. There will be rolling demonstrations of popular software programs such as *Introduction to Basic Part I and Part II* and the full range of utility programs for the home

Of particular interest is the latest 3D game called *Soccer* which utilises the remarkable spate locality of the Commodore 64. Also on show will be the range of Vic-20 and Commodore 64 peripherals which harness the power of the computer and exploit its full potential. Commodore staff will be on hand to give demonstrations to visitors and a few machines will be available for 'hands on' experience

Commodore Business Machines, 675 Ajax Avenue, Trading Estate, Slough, Berks
SL1 4BG Telephone Slough
74111 Contact: Adrian Butcher.

VISA SOFTWARE Stand B117

Visa will be exhibiting **VIZAWRITE 64** a high performance low-cost word processor designed especially for the Commodore 64. It takes full

advantage of the colour, graphics and memory capabilities of the computer to bring you the power and style of a dedicated word processor

Sensuous word processor users expect their word processor to format their text as they type. **VIZAWRITE 64** does this instantly. Tabs, indentation, centering are all clearly visible and easily altered, so you know exactly the format of your text all the time

VIZAWRITE 64 is a disk based word processing program. Cost £69.00 plus VAT (£79.35)

Also on show will be the **Commodore 700** and **VIZASPELL**.

Vize Software, 9 Mannon Row, Brompton, Gillingham Kent
ME7 5SE Contact: Kelvin Lacey.

VNU Business Publications Stand A25/A126

VNU Business Publications bring you its successful microcomputer titles

MicroDecision—the leading microcomputer magazine for businessmen. Written in non-technical jargon-free language with applications directly related to your business

Computer Answers—a lively informative microcomputer magazine that is specifically directed at the end user. It guides the reader towards the understanding needed to optimise and expand his kit

What Micro?—the definitive buyer's guide to microcomputer hardware and software. Each month there are news, views, comparative reviews, bench tests and user panels all geared to the Buyer

Personal Computer World—on sale at newsagents every month for 85p, Britain's largest selling micro magazine. It covers the whole spectrum of microcomputing with news, reviews and up to the minute benchmarks on current hardware and software

Personal Computer News—Britain's leading weekly microcomputer magazine. Special features include regular Top 20 sales charts, program cards and a pull-out library of microcomputing. First with news and reviews. PCN costs 50p every Friday

VNU Business Publications, 62 Oxford Street London W1A 2HG, Telephone 01-323 3311 ext 376 Contact: S. Holliday.

Vulcan Electronics Stand B103

Vulcan Electronics, actively established in the chess and home computer markets, is now distributing a new product to complement its expanding range of exciting hand held games and Spectravision cartridges (suitable for use on Atari VCS).

The new **Quicksilver Joystick** by Spectravision is suitable for use with the Atari VCS and both the Vic 20 and Commodore 64 home computers. It is an excellent step up from the standard joystick with a full 360° pivot and extra fire button making the unit ideal for both left and right handed players, in addition to a moulded grip for extra comfort

It is a design based on the latest of arcade-type machines and can be stuck on to any smooth surface with the aid of four suction pads. It is exactly what game players have been waiting for and since its introduction in March of this year it has become an accepted addition for Commodore computers.

It retails at £11.95 and is available from most computer shops and games centres all over the country

Vulcan Electronics Ltd, 200 Brent Street, Hendon, London NW4 Telephone 01 203 6366
Contact: David Bishop.

Wego Computers Ltd Stand B66/67

Wego Computers stand will be divided into two sections. The first will concentrate on their work as a Commodore Dealer and will feature ancillary products for the Commodore range

These include the Commodore approved Card Reader, Sequence Switch Boxes—which allow the computer and up to four peripherals to be powered up in the correct sequence with only one switching operation and **BackPack**—which prevents data being lost because of power cuts or line surges

The second section will display the **WordPro** series of software packages including **WordPro 2.3, 4.5, WordPro 3 plus/64, and Power**

Wego Computers Ltd, 22a High Street, Cateham, Surrey CR3 5UA Telephone 0883 49235

Kids, holidays and computers

where to learn computing

It's going to be a long, hot summer of course. Or maybe it will rain all the time (again). Either way there's nothing worse than a bored child during the long school holidays.

One solution: residential 'activity' holidays, usually lasting a week or two and combining a variety of activities. And there are a number of organisers with courses that are especially appropriate for kids with an interest in computers.

Here are some of the options we found. Most of these mix some computing with a variety of outdoor pursuits during the course, which can't be a bad thing. And the computing itself isn't necessarily just solitary programming — group project work is usually the norm, with sidelines like elementary robotics part of the syllabus. Sounds good!

Colony Holidays. Linden Manor, Upper Colwall, Malvern, Worcs. Phone 0648 40501

Charitable Trust running residential activity holidays based on the French 'Colonies des Vacances' system — as well as computing they take in crafts, drama, music, bird-watching. On the 13-day holidays (begin on a Sunday and end on a Friday) children spend three hours a day on the computer. As well as providing a basic introduction, there is also an emphasis on computing being part of the general activities at the camp, computing in inter-use with the other activities — eg the

Computer Holidays

This is Camp Beaumont — kids can choose microcomputing rather than canoeing, judo, sailing or archery. Each child get his or her own machine to work on (disks, too!)

▷ production of a camp newspaper. Groups of six are supervised by one monitor, with a micro to every two kids.

Prices: £159 for two weeks inclusive of travel — pocket money limited to 50p a day. **Dates:** 31 July-12 August; 14-25 August. **Location:** Over 20 rural centres throughout the UK, including some fine country houses.

Gainborough House Hotel, Bwedley Hill, Kidderminster, Worcs. Phone 0562 794041.

Residential weekend courses and weekly evening classes aimed at a mixture of children and adults (aged 16-65). Essentially an introduction to the basics of computing, with added emphasis on the social occasion. There are 20 places in a class, with one micro to two people, the course leader is the sole supervisor. The weekend courses last from Saturday morning (check in Friday evening) to Sunday afternoon; the weekly ones are organised as 10 two-hour sessions running over 10 weeks.

Prices: Weekend session — £55 (includes full board and there are full hotel facilities); weekly night classes — £20. **Dates:** For the weekend sessions the dates for September, October and November have not been finalised yet, so nng for

details. **Location:** At above address.

YHA Adventure Holidays, Youth Hostels Association, Trevelyan House, St Albans, Herts. Phone 0737 55215

Charitable trust. Computing course holiday, solely residential, for 11-year-olds up to adults; mainly practical work with a little history thrown in. The all-day course has a class size of 10 with two staff per class; everyone gets a computer to themselves. Additional benefits of the course include automatic membership of the YHA, a discount for rail travellers to the centre and free insurance.

Prices: Residential — £120 (includes instruction, board, lodging and recreational facilities). **Dates:** 16-23 July, 30 July-6 August; 6-13 August, 13-20 August. **Course duration:** of one week, from Saturday to Saturday. **Location:** Bath Youth Hostel, Bathwick Hill, Bath

Octopus Computing Holidays, Oxford Computer Training Services, Junction Road, Oxford. Phone 0855 711829.

Residential and non-residential courses for children and adults. Organised at three levels: introductory, intermediate and advanced, with emphasis on practical work — there is very little theory. All-day computing, though people can adapt

their schedule (eg computing in the morning, an afternoon off, more computing in the evening). Class size varies from 5 to 15 and staff/child ratio is about 1:5 — equipment is operated under close supervision. There are facilities for other activities, and accommodation is either in college residences or with local families.

Prices: Residential — £115; non-residential — £70. **Dates:** Season lasts from 20 July to 3 September and is organised in six-day sessions from Monday to Saturday. **Location:** At above address.

PGL Holidays, 110 Station Street, Ross-on-Wye, Herefordshire. Phone 0569 67681.

Residential computer holidays for children (ages 8-16, organised into three groups). Instruction at three levels — computers, robotics, 'psycho-bionics'.

A beginner should be able to write their first program within the first hour of instruction. The intermediate range will start at a higher level; with robotics children will learn how to control and build their own robot. It is mainly practical work. Structurally, the holiday is broken up into half-day computer classes and the other half spent engaged in a mixture of sports and outdoor activities. Class size between 6-15, with a staff/child ratio of 1:5; staff consisting of qualified and experienced teachers.

Prices: Residential — £130 (includes station pick-up). **Dates:** 16-23 July; 23-30 July; 6-13 August, 13-20 August. **Courses last from Saturday to Saturday. Location:** Eastbourne or Edinburgh

Millfield Summer School, Millfield Village of Education, Street, Somerset. Phone 0458 42291.

Residential and non-residential computing courses from a public school famous for its sports facilities and coaching. All the computing courses are "suitable" for those with an aptitude towards maths. The courses

are organised into two sections: the first one for kids between 8-13 (each child has a computer and most of the work is practical). The second group is for adults and young people of 14 years and over. This latter course is further divided into morning introductory classes for those who have little or no experience; afternoon courses take place at a higher level, and some experience will be necessary. Again, every person has his or her own computer. Class size in both cases is limited to 12 with one instructor per class. The courses are organised so that you spend half a day on computing and the rest on some other course, adults take part in at least one course occupying their first day.

Prices: Residential — £63, including board + VAT — £120. Non-residential — £30. **Dates:** 8-12 August and 15-19 August are the only free dates left. These last from Monday to Friday. **Location:** At above address.

Oakham Activity Holidays, Oakham School Chapel Close, Oakham, Leics. Phone 0672 3072.

Residential or non-residential computing courses — basically aimed at adults, but also for accompanied children (ages 9-14). Organised so that you can either choose to do computing all day, or spend half a day on the computer and the rest of the day on recreational activities for which there are 'numerous' facilities. Class sizes are usually 10 to 12 people (two per computer is the norm). It's mainly practical work, the teaching led by the director of the course assisted by up to three computer studies undergraduates. The course lasts six days.

Prices: Residential — Adults £120, children £100. Non-residential — adults £60, children £50. **Dates:** 24-30 July; 1-6 August (virtually full); 7-13 August (all-day computing courses only, but games facilities are open). **Location:** At above address. □

MICROS AT OAKHAM

Residential or non-residential courses for those who wish to learn to program or for those who require independent advice on the use of computers in their home or business.

There are also courses for accompanied children (age 9-14).

Equipment includes Apple II and Sharp micros and word processing facilities.

Heated indoor pool, squash courts, badmington and tennis available.

24th-30th July, 7th-13th August

COMMODORE TRAINING COURSES

from

comtec

MULTI-MEDIA TRAINING

Comtec provides Education and Training services to business, industry and the professions. In the dynamic field of microcomputing we are a leading independent supplier of training courses for Commodore users. The following courses in the most popular software systems in these key areas of microcomputing application are currently available

- | | |
|--|--|
| ★ SILICON OFFICE — Basic (3 Days)
Advanced (1 Day) | ★ Database Management and Word Processing |
| ★ VISICALC — (1 Day) | ★ Financial Modelling and control of
Business Planning |
| ★ HORNET — (2 Days) | ★ Project Planning — matching Time and
Resources profitably |
| ★ WORDCRAFT 80 — (2 Days) | ★ Word Processing |

TRAINING is what is needed when you already have a system but we fully realise that **EDUCATION** is vital for people to gain an appreciation of the role of microcomputers in their professional lives. Education means developing a critical awareness, one of our contributions to this process is:

MICROCOMPUTER APPRECIATION (1 Day)

This is a short, intensive course to guide and help individuals and companies to gain a genuine understanding of the advantages and pitfalls in choosing, using and expanding microcomputerisation.

Comtec's professional approach to training means maintaining a substantial research and design programme. It also means being short, the courses above represent 'state of the art' services. We are also involved in the creation of custom-made course modules for corporate clients.

Courses take place regularly at our London training centres and are also arranged 'in house' at client locations.

RTTY on the Vic ...

Aerial

Figure 1: Old-style teleprinter hook-up

If you tune around a short-wave receiver, you'll hear an incredible array of signals from commercial short-wave broadcasts from all corners of the globe to Radio Amateurs talking to each other.

You'll hear morse code messages being sent by everyone from Radio Amateurs to foreign diplomats.

You'll hear the 'woodpecker' noises emanating from somewhere inside the USSR doing something that none of us is too sure about. You may even hear the bleepings from space satellites. And you'll certainly hear the regular warbling noises which are the sound of text being transmitted from one place to another — by Radio Amateurs, embassies or the world-wide news agencies such as Reuters.

Figure 3: RTTY codes

This type of signal is referred to as 'RTTY' — which stands for Radio Teletype; it is a means by which text can be sent over the air.

RTTY (or "ratty", as it is often pronounced) started shortly after the Second World War, when the old mechanical teleprinters were becoming readily available: most of the techniques and codes currently in use arise from the design and limitations of these early machines. Although many still use these mechanical (and noisy) teleprinters, increasing use nowadays is being made of computers to convert the signals to text and display it on the screen, and there are several ways of doing this on the Vic.

Code types

Two main types of this code are specified, although they are both identical in their treatment of letters and numbers, differing only in the handling of punctuation characters as can be seen from Figure 3.

The five-bit character is sent as a series of ones and zeroes. These are actually referred to as mark (current ON) and space (current OFF).

Figure 4 shows how the letter 'J', whose code is 01011, would be transmitted.

With nothing being sent, the signal sits at high level (mark) which is pulled low (space) to indicate that a character is about to be sent.

This special 'start' pulse is then followed by the five bits of the character (transmitted starting with bit 0); and a final mark (or 'stop' pulse) is transmitted — slightly longer than the others to allow the receiving machine to finish printing.

The sender is now back in its 'idle' condition ready to send the next character.

It doesn't take much mathematics to realise that five bits only allow a total of 32 characters to be sent. If you look at Figure 3 you'll see all 32 code combinations and their representations — the peculiar order of letters is a function of the mechanical decoding process used in those early machines.

You will also see that there are two columns — a 'letters' column and one for 'figures'; and there are special codes (11011 and 11111) to switch the receiver to 'figure' or 'letter' mode.

Figure 1 shows the hook-up required with the old mechanical teleprinters and Figure 2 shows the more modern approach.

The four fundamental requirements are a short-wave receiver, a tone detector, a computer to do the code conversions and a display to show the final text. Although it is possible to build your own tone detectors and write your own software, the necessary hardware and software for the code conversions are already included in two commercial packages available for the Vic.

Most computers and VDUs use some form of the seven or eight-bit ASCII code, but the design of the early mechanical printing machines dictated that a special code using only five bits was used.

DATA bits	LETTERS	FIGURES	FIGURES	FIGURES	FIGURES
all codes	SIGNAL	CODE	TAL UNIT	TDK-28

11100	M	*	*	*	*
11101	X	/	/	/	/
11110	V	1	1	1	1
11111	letters	letters	letters	letters	letters

NOTE: All codes are exactly the same for letters and figures, it is only some punctuation and control characters that differ. The 'car ret' is a 'who are you?' query which the receiving station would normally answer with some sort of identification code and 'car ret' is carriage return.

possibilities and products

by Mike Todd

Figure 2: Vic and RTTY

Radio amateurs in the UK must, by law, use the five-bit International Telegraph Code number 2 and also must send at a speed of 45.5 or 50 baud. (A baud is just a measure of the speed of transmission and can generally be accepted as the number of bits per second. If the 'width' of one bit is 20 milliseconds, the rate is 50 baud.)

The stream of ones and zeroes cannot be transmitted as it stands; it must be converted into an audio signal for transmission. By assigning one audio frequency tone to a mark and a different one to a space, it is possible to put together a complete audio signal which is the warbling noise that is heard on the short wave receiver.

Frequency shifts

The actual tones chosen depends very much on who is doing the sending, but radio amateurs generally stick to 1.275kHz for space and 1.445kHz for mark.

This is often generated by having an oscillator running at 1.275kHz and then shifting its frequency up by 170Hz when there's a mark signal

to be sent. The technique is referred to as *audio frequency shift keying* or AFSK.

There is another technique used where the actual tones are not transmitted. Instead the carrier frequency of the transmitter is shifted by the same amount. This is known as FSK. Assuming that we're transmitting on a frequency of 14090 000kHz, this would be our space frequency, and a mark would shift this to 14090.170kHz. For those with receivers designed to receive morse code or 'sideband' transmissions, it is possible to convert this shift in carrier frequency back into audio tones.

Apart from the radio amateur transmissions, there are also a host of commercial transmissions — including Reuters, TASS, weather stations and even embassies round the world and these use a variety of different sending speeds and frequency shifts.

Reception

Receiving a signal is a matter of leading the incoming audio tones into two tone detectors. One triggers on the space frequency and the other on the

SIP ACCOUNTING SYSTEM

Highly comprehensive program designed for 16K, 24K, VIC20 & Printer, 40 col VIC20, CBM 64. Makes an ideal introduction for you and your staff to the world of computer accounts

Features include:

- Menu driven - simplicity to use!
- 1 to 250 accounts per tape
- Day book
- Value and purchase ledger (as per 2 tapes)
- Multiple sub print
- Bill all or just one company
- 16 colour account statements (optional)
- 1 - 3 period carry on to next date tape
- Sub summary, debitors and creditors
- VAT 7 entry (net or gross)
- PLUS many, no no more features all in ONE program

Program specifications:

- SP 20.20 - 16K approximately 120 hours per data tape
- SP AC 20 - 24K approximately 200 hours per data tape
- SP AC 40 - 40 col - 24K x 30
- approximately 420 hours per data tape
- SP AC 64 - 64K approximately 800 hours per data tape
- 40 col - 64K x 30

mark frequency, producing a logical '0' or '1' at the output. Although it is possible to use only one detector, two are better, and they provide a degree of error-checking since if neither tone is being received no decoding should take place. (If only one detector were used, it would assume that a space was being received even if there was no tone present.)

The serial stream of ones and zeroes can either be fed into a hardware device known as a *Universal Asynchronous Receiver Transmitter*, or UART, for conversion into a parallel byte. Or a software equivalent of the UART might be used, with the software alone performing the conversion.

The flowchart in Figure 5 shows the basic principle involved. Note that once the start pulse is received we wait an extra half time period - this is to make sure that we continue sampling in the middle of each pulse for maximum reliability.

Transmitting the signal is slightly easier as far as the computer is concerned. It is simply a matter of presenting the ones and zeroes at the correct speed into a suitable audio oscillator for feeding into a transmitter - though it is useful to have computer control of

the transmitter to turn it on when sending.

As I've already mentioned, it is possible to build your own tone detectors and to write your own software to decode the signal but this requires a good understanding of the techniques of RTTY, the Vic itself, and machine-code programming too.

The alternative is to use one of the two commercially-available units - all you need is the receiver and the Vic, and a few other bits and pieces.

IDK-20 Ham Interface

This comes from Computer World in Holland and is one of a range of Vic peripherals from that company. It is a single board which plugs into the Vic's expansion port and contains two decoders - one for RTTY and the other for morse code, with both having facilities for transmitting and receiving. Its advertised cost of £89 doesn't take into account post and packing, import costs or the extra hardware required to operate it.

There are two very distinct sections on the circuit board. The first is the ROM containing the necessary software, the second is the

two tone detectors — the two sections are not connected together in any way and signals are led to the Vic through the user port, for which the connector is not provided

One thing that the ads don't tell you is that you'll need to add an external power supply for the tone detectors (a 6-0-6 volt mains transformer) and a connection to the user port. Figure 6 shows the necessary additional connections to get full use of the unit.

It is set up for two different space frequencies (1.275kHz and 2.125kHz) and two different shift frequencies (170Hz and 425Hz). But these can be changed, and instructions for doing this are provided.

Getting started

SY543000 starts the system running. This presents the name, address and call sign of the registered user; and from here, pressing the appropriate function key will access the RTTY or morse code facilities.

Tuning in to the signal can be fairly critical, but two LEDs are provided to indicate that a mark or space tone is being received. These are positioned on the interface board. I found that rather inconvenient and would have liked to have

seen some indication on the screen that those tones were being received.

Assuming that you've successfully tuned into a suitable RTTY signal you should immediately see the text begin to appear on the screen.

Baud rates of 45.5, 50, 57, 75, 110, 150, 200 and 300 are available. Baud rate selection is done using the shifted plus and minus symbol keys, with the current baud rate always being shown on the screen.

Although the baud rate can be altered from the keyboard, the space and shift frequencies can only be altered by changing connections (or switches if you've installed them) on the interface unit.

As soon as you press any key on the keyboard, the unit goes into transmit mode which — with some additional hardware — will turn the transmitter on. If you don't type anything for three seconds, the unit will revert to 'receive mode'.

In the early days of RTTY it was possible to prepare punched tapes of the most frequently-used messages, such as a CQ call (a general call inviting other amateurs to reply) test sequences and so on. With the TDK-20 several useful sequences are built in and these include the owner's call sign which is put into the EPROM when you order the unit. You can also store your own messages in one of the three available buffers, and subsequently transmit them simply by pressing the F1, F2 or F3 keys.

As well as sending and receiving RTTY signals, the TDK 20 also sends and receives morse code — known as CW. This it does fairly well, although it doesn't seem to cope with variations in sending speed as well as it might. It even provides an audio output to the TV set when sending, which could be a useful aid in learning morse code.

SIMPLY RIGHT SIMPLY WRITE

BUSINESS QUALITY WORD PROCESSING

HOME COMPUTER COST

SIMPLY WRITE has been a favourite with PET/CBM users since 1981. Now this low-cost, sophisticated program is here for other computers. The same full features, yet even cheaper. Uses special keys and colour for extra ease. (See 'VIC Computing' Feb 1983 for excellent review of VIC-20 version.)

TAL RTTY Module

This unit is very different to the Dutch offering. It is totally self-contained and requires only a minimum of connections (as shown in Figure 2) — it even has the necessary relay included for turning the transmitter on and off.

It too has the tone detectors on board, but it uses a UART chip in the module to do the conversion of the serial data to a parallel byte. This normally operates at 45.5 baud, but keyboard selection of other baud rates up to 150 baud is available by throwing a switch on the interface board.

The frequency shift is generally set to the normal amateur shift of 170Hz, with provision on the module for altering this if required. There are two LEDs on the board to indicate reception of mark or space tones. Again, I would have liked to have seen this indication on the screen.

The TAL unit seemed to cope better with errors in reception and wouldn't print garbage on the screen without your knowing that there'd been problems. There's even the facility to force the decoding mode to letters or figures in the event of the appropriate shift character being missed.

The other facilities provided are very similar to the Dutch

unit, although they're more thoughtfully designed. Four or five user-programmable messages are provided as well as a range of pre-programmed messages, and the call sign is embedded in the EPROM.

The text is semi-formatted on the screen to reduce the possibility of words being cut in half as the wrapped around the screen line, and the overall display is reasonably well constructed bearing in mind the limitations of the Vic screen.

Extras

Since I first tried this unit, some significant features have been added. The first is the ability to print text simultaneously to the Vic printer as it is being received. At first sight this may not seem so revolutionary but the way the Vic handles the printer means that printing while processing fast, real-time input is extremely difficult. The provision of this is possible only because the Vic is not being used to do the serial-to-parallel conversion, relying instead on the UART chip, it works well on speeds up to about 100 baud.

The second enhancement is the ability to recognise the owner's call sign in a special format and, when this is received, to print the received message. This means that if the unit is left monitoring a specific frequency any messages

Hand Radio

Directed towards the owner's call sign will be printed out. They don't even have to have been sent by a similar unit, they only have to conform to the necessary format (which is basically a standard message-switching format).

The units are hand-made to

order and this leads me to my main criticism. Mine was not very well constructed, it is very difficult to get at the circuitry, and once inside some chips have had their numbers scratched off — which makes servicing or modification almost impossible. ☐

Summary

Neither unit performed particularly well in the presence of the large amount of FRI (radio frequency interference) that the Vic produces — although it is possible to improve matters with a good aerial, careful cabling and significant shielding of the Vic and TV. Fed with a good strong signal, there was little to choose between the two units in terms of performance... though the TAL unit does provide some for of error indication on the screen.

It was also very much quicker, easier and cheaper to install and operate. The mass of additional hardware needed to get the Dutch TDK-20 running made a horrid mess and would really need to be put into a box, all of which will increase the cost.

If you want to send and receive morse code, the only choice is the Dutch unit. But by the time you've added some generators and

transmitter relay, the added cost of hardware and time (not to mention important costs) make it much more expensive than its advertised cost of £89 plus £5 post and packing would imply. You can see this unit in the Computer World ad in *Vic Computing*; the address is 99 Hilversweg, 1214JB Hilversum, Holland.

In terms of RTTY, I found the TAL unit slightly better to work with and with its new features I would consider it the better buy at £99.95. It's available from TAL Computer Division, 11 High Street, Leighton Buzzard, Bedfordshire.

There's a special group formed which is affiliated to the Radio Society of Great Britain called the British Amateur Radio Teleprinter Group (BARTG). If you want to know any more about RTTY, drop a line to its secretary Mr. E. Satta, 27 Cranmer Court, Kingston, Surrey — enclose an SAE. ☐

ISBN 0 7156 1706 0 £6.95

VIC Graphics

This book provides the reader with an introduction to programming techniques used to generate graphics displays on a Commodore VIC. Topics covered include: Using colour — Two dimensional shape plotting — Shape plotting — Shape scaling and stretching — Shape movement — Shape rotation — Flopping using matrix manipulation — Three dimensional shape plotting. VIC Graphics is a must for every VIC user who wishes to use the machine to its maximum graphics display potential.

The Commodore Super Expander is required to run the programmes in this book.
ISBN 0 7156 1702 8 £6.95

VIC Revealed

This book goes deep within the VIC20 to show you its innermost secrets. Each chip within the VIC is analysed and its function described. For those interested in electronics, comprehensive circuit diagrams are also given. A detailed memory map points out useful memory locations. Entry points to various VIC KERNAL routines are also given. Useful programs enabling you to produce your own high resolution graphics and sound on the VIC are also included.
ISBN 0 7156 1638 4 £5.95

Other titles in this series include: *Spectrum Graphics, Spectrum Programmes 1, SBC Programmes 1, Hugsan, Programmes 1, SBC Graphics, Drives Graphics and Commodore 64 Revealed*. Accompanying cassettes available from the publisher. Write in for the descriptive leaflet.

GIVE YOUR VIC20 & 64 IEEE PLUS RS232

VIC and 64 users

Would you like to be able to access any of these peripherals from your computer?

- 1/4 megabyte disks (Commodore 4040 drive)
- 1 megabyte disks (Commodore 8050 drive)
- 10 megabyte disks (Commodore 9090 hard disk)
- Printers including a wide range of inexpensive IEEE and RS232 matrix and quality printers
- IEEE instruments such as volt meters, plotters etc.

Now you are no longer limited by the VIC or the 64's serial bus. Simply by attaching INTERPOD you can vastly increase the power of your VIC 20 and when used with the new 64, INTERPOD

turns the computer into a really powerful system.

With INTERPOD the VIC and 64 become capable of running really professional quality software such as Word-processing, Accounting, Instrument control and many more.

INTERPOD will work with any software. No extra commands are required and INTERPOD does not affect your computer in any way.

Using INTERPOD is as easy as this:

Simply plug INTERPOD into the serial port of your computer, power-up and you are ready to communicate with any number of parallel and serial IEEE devices and any RS232 printer

Programmers Aids

The basic Vic is a useful little machine with enough built-in facilities for programs of reasonable complexity to be written after only a few days at the keyboard.

But as it stands it's not perfect — you might want more facilities. Increasing its capabilities is often a matter of adding extra memory. Whichever way you do it, programs can become more adventurous; and you can start to make more use of the graphics and sound capabilities of the Vic than was previously possible.

But to do this does require those intimidating PEEKs and POKEs, both to set up the high-resolution graphics and for the tediously slow maths involved in plotting points, lines and curves. Programming can eventually become something like wading through treacle.

Both Commodore and Stack have produced extensions to the Basic language to make programming these features very much easier — these are the Commodore Super Expander cartridge (which also comes with 3K of RAM) and the Stack Vikiit III chip, both of which I'll be looking at later. They add extra commands for use within pro-

grams and that does make the programming much easier. But those programs must subsequently be run on a machine which has the extension installed.

On the other hand there are programming Aids. These differ from extensions to Basic in that they are designed for use only during programming and are not required for actually running the program. In fact, no-one looking at the finished program would know that these aids had been used.

We found four add-on programmer's aids for the Vic — from Commodore, Stack, DAMS and Audiogenic. Mike Todd put them through their paces.

all lines which contain a specified sequence of characters

KILL: Disconnects the Aid if it is interfering with any aspects of the Vic. (VICKIT requires a SYS command to perform the same function.)

MERGE/APPEND: Allows programs on disk or tape to be included in a program already in memory. APPEND simply tacks the new program on to the end of the program in memory, taking no account of line numbers. If the new code has lines with the same numbers as the original program, they'll overwrite the existing ones. MERGE actually treats the lines of the new program as if they had been typed at the keyboard and puts them in their correct place.

CHANGE/EDIT: Like FIND, will locate all occurrences of

All four Aids have very similar commands for the user. There are however some significant differences in the way that these are implemented, and they're not necessarily all available on all four. These commands are listed in the table.

AUTO: Automatically provides line numbers when typing in programs, thus saving a little extra work. The starting line number and the increment can both be defined by you.

DELETE: Allows a range of lines to be deleted from a program.

DUMP: Prints out all variables currently in use, together with their values. Not on VIC-AID; and all but BUTI ignore arrays completely.

FIND: Searches through the program in memory and lists

Four contenders reviewed

by Mike Todd

the specified character sequence; but then will change each occurrence to another set of specified characters

HELP: When the program stops as a result of an error message, typing HELP will provide some indication of where the error is by highlighting the part of the statement where the error occurred. The HELP command on BUTI does something totally different, though.

RENUMBER: This allows entire programs (optionally on VICKIT and BUTI, a section of a program) to be renumbered; you specify the new starting line number and the line increment. It automatically takes care of any GOTOs, COSUBs or ON... GOTO/ GOSUB constructions; and provision is made for references to non-

existent lines to be given a line number of 65535 or 0 to enable them to be identified easily (Beware — all four Aids allowed programs to be renumbered with a line increment of zero — which results in a program having all line numbers the same! It's not possible to recover from this condition and the program has, to all intents and purposes, been lost.)

TRACE/STEP: Both TRACE and STEP allow the progress of a program to be watched — the line numbers appear in a box at the top right of the screen as they are executed. TRACE normally runs very quickly but can be slowed down by pressing a key STEP stops at the end of each statement and waits for a key to be pressed before executing the next one.

OFF: In all cases, OFF is used to turn the TRACE or STEP facility off.

VICAID

This is a ROM chip at £22.95. It requires a ROM socket to be available and DAMS makes a suitable 'RAM-in-ROM' board for £26.40 which also contains 3K RAM plus an additional socket suitable for its machine-code monitor ROM.

VICAID is normally supplied to occupy memory addresses from 40960 to 45085 (\$A000-\$AFFF) and is automatically activated when the Vic is switched on.

In those locations it clashes with many games cartridges. VICAID is also available in a version that takes 24576-28671 (\$6000-\$6FFF) where it cannot

be used if more than 16K RAM expansion is installed, or at 45086-49151 (\$B000-\$BFFF) where it will clash with the larger (8K) games cartridges — these two require SYS commands to activate them.

VICAID doesn't have the DUMP command, nor any special extra features. But it does have a (very simple) machine-code monitor (access by typing BREAK) and the ability to read the position of a light pen on the screen. My feeling though is that an Aid package is not the place for such a facility.

There is also a problem with its RENUMBER command if line numbers beyond 63999 are produced. The other

three Aids generate an error message in this case, VICAID continues to renumber, with the resulting line numbers "wrapping around" to start again at 0. The result is a corrupted program, needless to say.

If VICAID is disabled using KILL, it is possible to enable it again simply by press RUN/STOP and RESTORE together.

VICKIT I

Again, Stack's Aid is a single ROM chip (£28.75), but this one requires a SYS command to activate it. It needs an expansion board with a ROM socket available — Stack produces several different boards which would be suitable all of which will up the price considerably.

Stack also has its Supercharger Plus for £51.75, that includes 3K RAM and the extended VICKIT II.

VICKIT occupies RAM locations 45086-49151 (\$B000-\$BFFF), which will conflict with any 8K games cartridges installed.

Of all the Aids tested, VICKIT is the least versatile and therefore least useful. It doesn't have the CHANGE command, and additional features are limited to the LIST command which lists lines one at a time each time the space bar is pressed. I found this feature very irritating and wished it could be disabled if not required, especially since the CTRL key can already be used to slow down a listing.

VICKIT also had some odd quirks — for instance, if you typed HELP after an error at the end of a statement no characters would be highlighted. It also has a dangerous feature in DELETE where, if only a single line number is specified (e.g. DELETE 10), the whole program from line 10 to the end is deleted! The entire program could also be erased by RENUMBER under certain circumstances.

Programmer's Aid

This is a standard Commodore cartridge which plugs straight into the Vic and is activated by a SYS command. It costs £34.95, and is fully self-contained.

It occupies memory locations 28672-32767 (\$7000-\$7FFF in hex) and so cannot be used if there is already RAM at these locations, that would be the case if more than 16K of RAM expansion has been installed.

The Programmer's Aid has two sets of 12 useful character sequences 'embedded' in the function keys. The first of them (used while editing a program) provides single-key entry of such sequences as 'LIST', 'AUTO', 'TRACE' and so on and for programming there are several ready-to-use Basic keywords available such as 'MID\$', 'INPUT' and 'RETURN'.

Using the KEY command, the programmer can obtain a list of what each function key will produce and you can also define your own key functions.

MERGE allows frequently-used subroutines (which have been SAVED in the normal way) to be merged into an existing program in memory. This facility doesn't just append the new program on to the end of the old, but actually interleaves program lines as necessary — just as if they'd been typed at the keyboard.

Six control key sequences are also provided (press CTRL and the key together) which will clear the screen from the cursor, or just to the end of the current line, or the whole of the current line. They also allow the annoying quotes mode to be aborted and to LIST a program forwards and backwards — in other words you can use the screen as a window into the program and move it up or down to see the section you want.

RAMSHAW

COMMODORE 64 GAMES BOOK

Teach your Commodore 64 every trick in the book.

With the best software games book ever for your Commodore 64.

This mind blowing collection of game programs written by Software wizards Clifford and Mark Ramshaw, will turn your Commodore 64 into an entire arcade of electronic fun and thrills. Experience action so fast and furious it will shatter all your concepts about computer game excitement.

The Commodore 64 Games Book is packed with nerve shattering space and adventure games, and includes intriguing strategy games too! Some programs even contain machine language routines.

Every game maximises all the Commodore 64's sophisticated features, including its innovative Sprite capability. And you don't need complex programming skills, because all these programs are very easy to enter.

If you want to know every trick in our book, order your copy today. Book £5.95.

All programs from this book are also available on cassette. Each cassette contains 15 programs. £6.95.

We can teach the VIC 20 a few tricks too!

VIC 20
INNOVATIVE
COMPUTING
Clifford Ramshaw

Vic Innovative Computing

30 highly creative game programs that will open a new dimension of thrills and excitement for every VIC 20 owner. Featuring arcade favourites like Hoppy Nuclear Attack, Space Flight and Chess.

The specially designed format ensures that all the programs are very easy to understand and enter.

These programs are also available on a set of 3 cassettes. Book £5.95. Each cassette £5.95.

Vic Games Pack

Five fantastic space games on one cassette, including Invaders, Storm and Ground Attack. Every game makes full use of the VIC 20's stunning graphics and sound.

Also included are two 100% machine language programs: Alien Blitz and Space Rocks. This Game Pack is the ultimate test of nerves and skill - amazing value for only £5.95.

Wizard and the Princess

In this multi-part medieval graphics adventure, you are a bold knight who must rescue the beautiful princess from the grasp of an evil Wizard.

To succeed, you must slay the castle's dragon, breathe dragons and fight the evil troll to the death. A challenge that pushes you and the capabilities of your VIC 20 to the limit.

Cassette for standard VIC 20 £5.95.

Buti Plus

Audiogenic's BUTI (pronounced 'beauty') comes with 3K of RAM and a machine code monitor built in. It occupies 40960-49151 (\$A000-\$BFFF) and is automatically activated on switching on the machine code monitor is at 24576-32767 (\$6000-\$7FFF).

Although there's only 8K of ROM on board, inadequate address decoding results in this occupying 16K of memory space. It can't be used with more than 16K of RAM expansion.

Although there are nowhere near as many commands available as on the Commodore cartridge, they are all well thought out and

contain good error checking.

There are a couple of extra commands available too. As well as a decimal/hex/binary converter, and a facility to recover a program which has just been NEWed, there is a VIC command which allows reconfiguration of an expanded VIC. For instance, VIC on its own will

reconfigure the Vic as though it had no memory expansion at all.

The error indication facility, provided using HELP on the other Aids, happens automatically. Whenever a program error stops the program, the line in which the error occurred is listed with the position of the error highlighted.

All of this.

For the price of this. Only £139.99.

For one month only*, you can get a complete Commodore computer system for the price you'd expect to pay for the VIC 20.

It's a complete computer system a Commodore VIC 20 computer, a cassette unit, a simple explanation of computer programming—"Introduction to Basic Part 1", plus an exclusive compilation tape of four computer programs, (Blitz, Type-A-Tune, Race and Hopput).

And, while stocks last, all that can be yours for just £139.99. Which is almost exactly the price you'd normally have to pay for the VIC 20 alone.

There's only a limited number available, so we recommend you visit

your nearest VIC 20 stockist as soon as possible.

ALL ABOUT THE VIC 20

They say it's the best home computer in the world, and no wonder! There are educational programs for 5 year olds and up (spelling, physics, arithmetic etc.) Plus music, typing, chess and home accounts. And, of course, all those marvellous arcade games.

You'll soon be exploring new worlds of colour, animation and sound. With a vast choice of programs and unlimited scope for entertainment. All right at your fingertips.

*Or while stocks last. Details correct at time of going to press.

YOU CAN SEE THE VIC 20 AT ALL BRANCHES OF DIXONS AND WALLACE HEATON, AND AT SELECTED BRANCHES OF BOOTS, RUMBELOWS, LASKYS, CURRY'S, GREENS, ORBIT, MICRO C, RANK XEROX, WIGFALLS, SPECTRUM, COMET, JOHN LEWIS, WOOLWORTH, REDIFFUSION, CO-OP AND OTHER GOOD RETAILERS.

ALSO AT BRANCHES OF A NATIONAL NETWORK OF COMMODORE COMPUTER DEALERS.

Super SID!

Inside the 64's sound synthesizer

by Kent Multer

Commodore's model 6581 Sound Interface Device (SID) in the 64 is truly impressive: an entire music synthesizer on a single chip. In this article Kent Multer describes SID's features and gives you some ideas on how it can be used.

Figure 1 shows a block diagram of the SID chip. As you can see it has three voices (meaning it can produce three notes at once).

Each voice consists of a tone generator, which produces the sound, and an envelope generator, which controls the volume. There are also some modulation effects, in which two tone generators combine to produce one complex sound.

The signals from the voices may be routed through a filter, which acts like a super tone control. This is the thing that makes SID so powerful and so much more versatile than the sound generators on other home computers.

Other features of SID include master volume control and an external audio input that allows you to run a signal from your electric guitar or other source through SID's filter.

There are also two A/D converters on the chip, intended for connecting to potentiometers. These are not electrically connected to anything else in SID, so you can use them for game controllers or whatever.

SID's functions are controlled by a number of eight-bit registers in Commodore's machine. The chip is mapped into the memory address space so you can write data into the registers with POKE statements. Each voice has seven registers for controlling its specific functions, and there are eight more registers for controlling the filter, master volume, etc. Figure 2 illustrates the control registers.

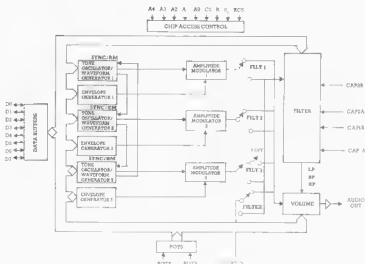

Figure 1: Block diagram of the SID

Tone generators

SID has three tone generators, each of which can generate four different waveforms: sawtooth, triangle, pulse, and noise.

Sawtooth waves contain lots of harmonics, and are good for rich sounds like horns or strings. Triangle waves only have a little bit of harmonic energy, so they have a very mellow, flute-like sound.

Pulse waves can have a lot of different sounds, depending on the pulse width, which you can vary. When the pulse width is at or near 50 percent, you get a square wave, which is sort of hollow.

▷ or clarinet-like. When the pulse width is close to zero (or to 100 per cent — they both sound the same to the ear), the tone is very thin, more like an oboe. In between is an impressive variety of sounds, including saxophones and sometimes human voices (if you set the filter right).

The noise waveform has no precise pitch, it's used for untuned sounds like percussion, wind or jet engines. With this waveform, low notes come out as a deep rumble and high notes sound like a snake's hiss.

The frequency of each tone generator is set by a 16-bit number that you POKE into two control registers (high and low bytes). The output frequency in Hertz is equal to the number in the registers multiplied by 0.0596.

Table 1 gives the numbers that you use for the notes of

the musical scale. SID has a range of eight octaves; is that enough for you? It ought to be; it's more than almost any conventional instrument can play.

With 16-bit frequency control, there are a lot of piches in between the notes of the scale. You can generate glissando or portamento effects by rapidly incrementing or decrementing the number in these registers, so that the sound makes a smooth sweep from one pitch to another. You can also set two or three tone generators to be just a tiny bit out of tune with each other, which gives a rich, chorus-like quality to the sound.

Actually, SID's range is more than eight octaves; it can be tuned so low that you can't hear it, down to about one cycle every 16 seconds! We'll look at uses for the sub-audio range a little later.

Control registers

Each voice has a control register that contains one bit for each of the four waveform. If you turn on more than one of these bits, the resulting sound will be a logical ANDING of the selected waveforms. This could give you some interesting effects but usually you will only use one waveform at a time.

A word of warning: combining the noise waveform with any others may 'lock it up', cancelling the noise output until you reset it with the Test bit or the chip Reset line.

When you select the pulse wave, the pulse width is set by a 12-bit number which occupies two control registers. You can sweep the pulse width smoothly from one value to another, which gives a very nice soaring or 'phase shifting' sound.

The control register contains bits for ring modulation and synchronization functions. These two effects are similar; they both take input from two tone generators and produce an output that has some components of the inputs plus some other frequencies that aren't present in either input.

This can produce metallic sounds such as chimes and gongs. If you vary the frequency of one of the inputs while listening to the signal, you get a great science-fiction-type sound in which you can hear some pitches rising, while others are falling at the same time. Note that the ring-mod function only affects the triangle wave output, but the synch function applies to all waveforms.

The difference between the two effects is something that

Mugil

I can't really describe in words, so I suggest you just try it. For some wild sounds, you can use both effects and once. For example you can set voice 2 to be in synch with voice 1, and set voice 3 to be ring-modulated by voice 2. I once did something like that with an ARP 2600 synthesizer and got a really nice simulation of someone banging on a garbage can.

Each voice has a Test bit: when set to 1 this turns off all waveforms and resets the internal counters to zero. Commodore's spec sheets suggest that this feature may have some musical applications, but do not give any specific uses.

I do have a couple of ideas, though, if you want to create a complex sound by combining two or three voices, you can use the Test bit to make sure that all the tone generators start their waveforms at the same moment, otherwise the slight delay might produce random variations in the sound. Also, the Test bit can be used to turn a voice on and off instantly, whereas using the envelope generator takes at least a few milliseconds.

Envelope generators

This is another important synthesizer function. The term 'envelope' refers to the way in which the volume changes during the playing of a note.

Each note is divided into four phases called *attack*, *decay*, *sustain*, and *release*. In the *attack* phase, the volume rises from zero to a maximum or peak value. Then, during the *decay*, the volume falls off to some intermediate level. Next comes the *sustain*, in which the volume remains constant for as long as you want to hold the note. Finally, during the *release* the volume falls back to zero.

The attack, decay, and release times, as well as the difference between the peak and sustain volume, are important factors in making one instrument sound different from

Fig 3: Typical Sound envelopes

another. For instance, as Figure 3 shows, a trumpet has a very short attack and decay time, giving a quick snap of loud sound at the beginning of each note. Then the volume remains constant as long as the musician keeps blowing, and when he or she stops, the note takes a tenth of a second or so to die out (release).

Compare this to the violin envelope, which has a slow attack and no pronounced peak. The xylophone, by contrast, has a very fast attack but no sustain at all; the note always dies away quickly.

Each voice in SID has its own controls for attack, decay, sustain and release. Each of these parameters is controlled by a four-bit number

that can select one of sixteen possible values. The attack and decay are set by one control register, and the sustain and release by another.

Attack times range from two milliseconds to eight seconds. The decay and release times range from 6 milliseconds to 24 seconds. The sustain is not a time, it's a volume. If it is set to maximum (15), the volume will remain at the peak level, like the violin envelope in Figure 3.

The envelope generator is activated by a bit in the voice's control register called the Gate. (This is a synthesizer term, not really related to the logic gates computer buffs are used to.) Setting the Gate to 1 starts a note; it causes the envelope generator to do its attack-decay-sustain phases

When the Gate is set to 0, the note begins its release phase.

Note that the attack has a linear slope, but the decay and release have an exponential curve. This is a nice touch; it corresponds to the way that strings, horns and other vibrating objects generally behave. Most synthesizers do either linear or exponential slopes — but not both.

Filter section

The filter, in a sense, is the heart of a synthesizer. Granted, it doesn't actually produce sound; it just modifies what the tone generators produce. But you will find that the filter has more control than anything else over what you hear. I'd rather have one waveform and a filter than a whole lot of waveforms and no filter.

The filter's function is similar to the tone controls on a hi-fi, in that it allows you to emphasize or remove certain parts of the audio spectrum. The range of possible effects is shown graphically in Figure 4.

SID's filter has three outputs. The *low-pass* output, as its name implies, will pass all signals below a certain frequency, called the cutoff frequency. Everything above the cutoff is 'rolled off' (reduced in volume) at a rate of 12 dB per octave; the higher the frequency, the more it is reduced.

Similarly, the *high-pass* output passes signals above the cutoff, and rolls off everything below it. The *band-pass* output rolls off frequencies above or below, and passes only those signals that are fairly close to the cutoff frequency.

Each of the filter's outputs is controlled by a single bit in one of SID's registers. So by setting several bits to 1 you can mix the outputs. Mixing the high-pass and low-pass outputs gives what is called a *notch filter*. This is the opposite of the band-pass; it rejects frequencies near the cutoff, and passes everything else.

▷ The cutoff frequency is selected by an 11-bit number that you poke into two control registers. With the recommended 2200pf capacitors, the cutoff frequency can range from 30Hz to 10kHz.

The filter also has a resonance or 'Q' control. This determines how strong the effect is. With low resonance, the sound is not too different from your hi-fi's tone controls.

With high resonance, you get a very intense effect, like different vowel sounds of the human voice. A rock guitarist's wah-wah pedal is just a band-pass filter with a very high resonance. It goes 'wah' when the musician raises the cutoff frequency by pushing down on the pedal, and it goes 'yow' when he or she lowers the cutoff by moving the pedal the other way. You can produce the same effect with SID by selecting a high resonance and then varying the cutoff while a note is playing.

Most synthesizers provide

an envelope generator that controls the filter cutoff, allowing it to automatically rise and fall every time a note is played. SID does not have this feature, but you can write a program to do it.

Some of the more expensive synthesizers can also change the resonance in the same manner. The effect is more subtle, but useful to the advanced synthesist. With SID, once again, you can do this under program control; isn't software wonderful?

Each of the three voices can be routed through the filter, or it can be sent directly to the main output. This feature helps make up for the fact that there are three voices but only one filter. You can filter one voice, and use pulse width changes to produce filter-type effects on the other two.

Other features

As I mentioned earlier, SID has an external input that can be used with any instrument, recording, or even a

microphone. This input can be sent through the filter, or it can go directly to the output. (With a microphone or instrument you may need to amplify the signal before running it into SID; the maximum input is three volts peak-to-peak.)

SID has a master volume control that ranges from zero to 15. This controls all the voices, the filter, and the external input. You can produce tremolo effects by rapidly raising and lowering the volume.

Voice 3 has a couple of special features that are quite handy. There is a register that you can read to get the instantaneous value of the tone generator's output, and another that lets you read the envelope generator's output.

What are these good for? Well, earlier I mentioned that it would be nice to have another envelope generator to control the filter. You can use voice 3's envelope generator to do this, by putting some statements in your

▷ program to read the envelope value and POKE it into the filter cutoff.

You can use the waveform value register in a similar manner. For instance, set up voice 3 to produce a triangle wave at a very low frequency, say 3 or 4 Hz. Then write a program that continuously reads the waveform value, and adds to it the frequency numbers for voice 1 and/or 2. The result is vibrato: continuous up-down variation of the pitch.

Of course, when you're using voice 3 in this manner you probably won't want to listen to it at the same time. Fortunately, there is a control bit that disables voice 3's output so that it won't produce unwanted sounds.

One other use for voice 3: if you set it to the noise waveform at some very high frequency, the waveform value at any instant is essentially random. Thus you have an instant random number generator.

Mugil

▷SID contains two A/D converters that are intended for connection to potentiometers for use as game paddles or other control functions. You might buy a used wah-wah pedal, tear out all the electronics, put in a 470K pot, and run it to one of the A/D inputs. Presto, you've got a wah-wah pedal for your computer or a volume pedal, or a tremolo pedal, etc. Like I said, isn't software wonderful?

The A/D inputs are scanned about once every half a millisecond, so it's possible that they could be used to listen to an external sound and compute its pitch. Then SID

could play or sing along with you.

Technical details

Originally I was going to title this section 'Bugs' or 'Criticisms'; but really this chip is so wonderful that I couldn't bring myself to use such derogatory language. There are one or two things that I just couldn't resist pointing out, though.

Most of the control registers are 'write-only,' meaning that you can POKE things into them but you can't PEEK at them to find out what their current settings are. So you may need to store their values in a table, and have your program up-

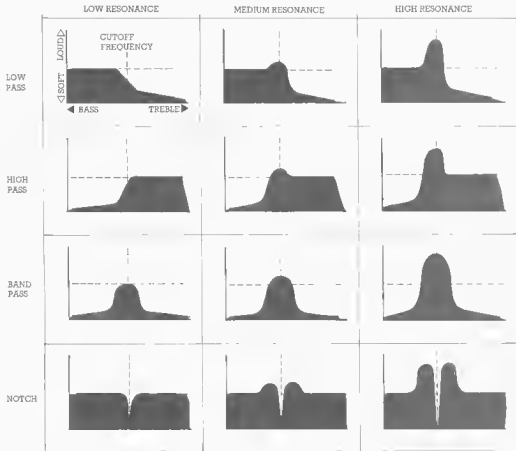

date the table whenever it changes one of the registers.

If you've used some other synthesizers, you may notice that SID's filter effects are not quite as intense as you expected. This is because SID's filter has a 12 dB per octave roll-off, whereas most synthesizers have 24dB per octave. You can always set two SIDs, however, and run one into the other through the external input. It'll still cost a heck of a lot less than a new Korg or MiniMoog.

Although SID has a master volume control, it does not

have controls that let you set one voice louder or quieter than the others. This could be a problem if you're trying to play a fairly complex piece of music with a lot of variety between the voices. In a pinch, you could write a program to switch a voice's Gate signal rapidly on and off, so that the volume hovered around some intermediate level.

In summary, my hat is off to Commodore for producing a chip that turns a home computer into a real synthesizer. The musical world is bound to be rocked by this exciting development. □

A NEW SERIES FOR FIRST TIME USERS

These titles are the latest in a new series of books which introduce newcomers to the most widely used micros in the marketplace.

The "Learning to use" series of books assume absolutely no knowledge about computers and the reader is shown even the most fundamental operations such as "switching on" and "loading a program". The books lead the reader through simple programming and then onto graphics, with several programs which show how to achieve pictures and even animation.

The user-friendly approach is consistent throughout the text - not only are program listings clearly shown, but in many cases, a photograph is included to show what the program looks like when actually loaded and run!

The books contain a number of specially written programs which show the full potential of these machines.

GIVE YOUR VIC EYES!

Hold the LIGHT PEN like a normal pen, point it at your TV screen and the pen tells your VIC-20 what it sees!

Instead of pressing keys, touch the screen with your LIGHT PEN and move your man in CHESS, create LIFE, play OTHELLO, take in DRAUGHTS, play GO.

Point the pen at your man and move him to his new position.

Many games are already available for the LIGHT PEN and many more are being developed. You can write programs which allow you to read with your LIGHT PEN from the TV screen or place images or words on the screen. e.g. From a long list on your screen use the LIGHT PEN to choose the facts and figures you want.
